### D7.3.10 DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register DBGVCR from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

**Traps and Enables**

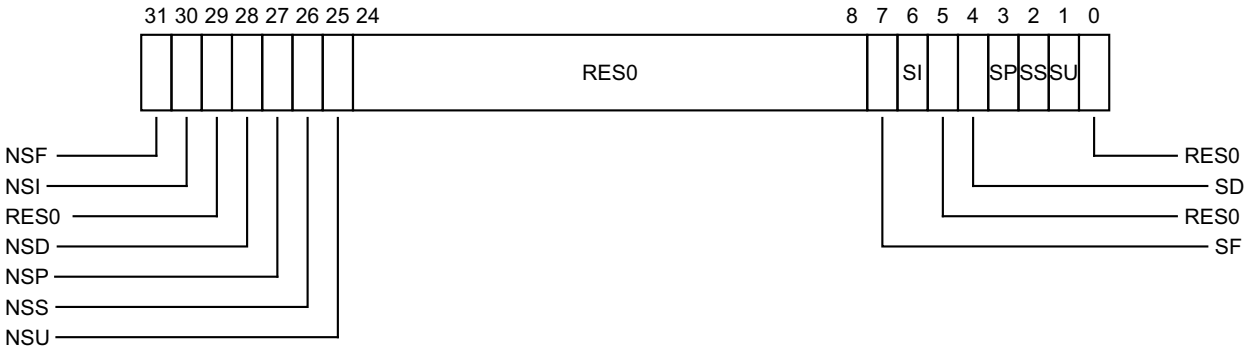
There are no traps or enables affecting this register.

**Configurations**

AArch64 System register DBGVCR32_EL2 is architecturally mapped to AArch32 System register DBGVCR.

If EL1 does not support AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.



**Attributes**

DBGVCR32_EL2 is a 32-bit register.

#### Field descriptions

The DBGVCR32_EL2 bit assignments are:

***When EL3 implemented and using AArch64:***

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is `0x08`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is `0x04`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [24:8]**

Reserved, RES0.

**SF, bit [7]**

FIQ vector catch enable in Secure state.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SI, bit [6]**

IRQ vector catch enable in Secure state.

The exception vector offset is `0x18`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is `0x08`.

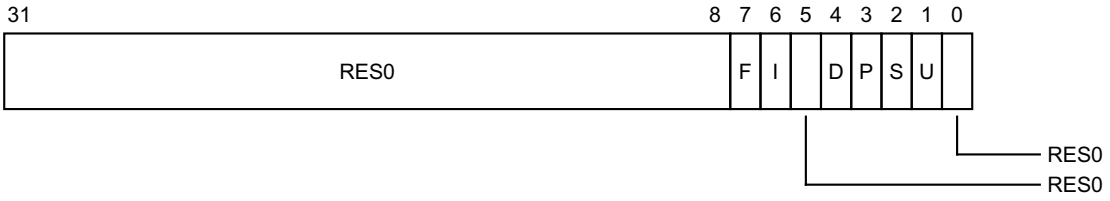
When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SU, bit [1]**

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is `0x04`.



When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [0]**

Reserved, RES0.

***When EL3 not implemented:***

**Bits [31:8]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**F, bit [7]**

FIQ vector catch enable.

The exception vector offset is `0x1C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**I, bit [6]**

IRQ vector catch enable.

The exception vector offset is `0x18`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [5]**

Reserved, RES0.

**D, bit [4]**

Data Abort vector catch enable.

The exception vector offset is `0x10`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**P, bit [3]**

Prefetch Abort vector catch enable.

The exception vector offset `0x0C`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**S, bit [2]**

Supervisor Call (SVC) vector catch enable.

The exception vector offset is `0x08`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**U, bit [1]**

Undefined Instruction vector catch enable.

The exception vector offset is `0x04`.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bit [0]**

Reserved, RES0.

### Accessing the DBGVCR32_EL2:

To access the DBGVCR32_EL2:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRS <Xt>, DBGVCR32_EL2 ; Read DBGVCR32_EL2 into Xt
MSR DBGVCR32_EL2, <Xt> ; Write Xt to DBGVCR32_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 100 | 0000 | 0111 | 000 |

Non-Confidential - Beta

### D7.3.11 DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

When the E field is zero, all the other fields in the register are ignored.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 and *Software Access debug event* on page H3-4881.

Subject to the prioritization rules:

If EDSCR.TDA==1, OSLSR.OSLK==0, and halting is allowed, EL1, EL2, and EL3 accesses to this register generate a Software Access debug event.

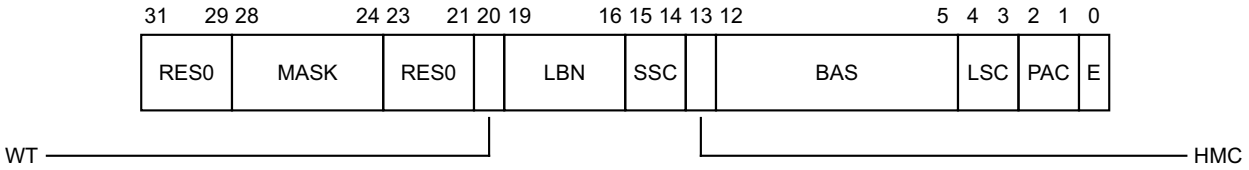
If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register DBGWCR<n>_EL1 is architecturally mapped to AArch32 System register DBGWCR<n>.

AArch64 System register DBGWCR<n>_EL1 is architecturally mapped to External register DBGWCR<n>_EL1.



If breakpoint n is not implemented then this register is unallocated.

**Attributes**

DBGWCR<n>_EL1 is a 32-bit register.

#### Field descriptions

The DBGWCR<n>_EL1 bit assignments are:

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

`00000` No mask.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`00001` Reserved.

`00010` Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from `0b00011` masking 3 address bits (`0x00000007` mask for address) to `0b11111` masking 31 address bits (`0x7FFFFFFF` mask for address).

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

`0` Unlinked data address match.

`1` Linked data address match.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

| BAS | Description |
|---|---|
| xxxxxxx1 | Match byte at DBGWVR<n>_EL1 |
| xxxxxx1x | Match byte at DBGWVR<n>_EL1+1 |
| xxxxx1xx | Match byte at DBGWVR<n>_EL1+2 |
| xxxx1xxx | Match byte at DBGWVR<n>_EL1+3 |

In cases where DBGWVR<n>_EL1 addresses a double-word:

| BAS | Description, if DBGWVR<n>_EL1[2] == 0 |
|---|---|
| xxx1xxxx | Match byte at DBGWVR<n>_EL1+4 |
| xx1xxxxx | Match byte at DBGWVR<n>_EL1+5 |
| x1xxxxxx | Match byte at DBGWVR<n>_EL1+6 |
| 1xxxxxxx | Match byte at DBGWVR<n>_EL1+7 |

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. ARM deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are `0b0000000`, or a binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software.

If BAS is zero, no bytes are watched by this watchpoint.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

`01` Match instructions that load from a watchpointed address.

`10` Match instructions that store to a watchpointed address.

`11` Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field resets to its defined reset value on Cold reset.

**E, bit [0]**

Enable watchpoint n. Possible values are:

`0` Watchpoint disabled.

`1` Watchpoint enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

### Accessing the DBGWCR<n>_EL1:

To access the DBGWCR<n>_EL1:

```
MRS <Xt>, DBGWCR<n>_EL1 ; Read DBGWCR<n>_EL1 into Xt, where n is in the range 0 to 15
MSR DBGWCR<n>_EL1, <Xt> ; Write Xt to DBGWCR<n>_EL1, where n is in the range 0 to 15
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0000 | n<3:0> | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.12 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564 and *Software Access debug event* on page H3-4881.

Subject to the prioritization rules:

If EDSCR.TDA==1, OSLSR.OSLK==0, and halting is allowed, EL1, EL2, and EL3 accesses to this register generate a Software Access debug event.

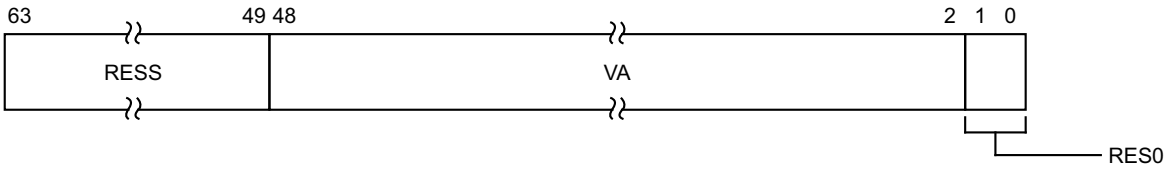
If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register DBGWVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGWVR<n>.

AArch64 System register DBGWVR<n>_EL1 is architecturally mapped to External register DBGWVR<n>_EL1.



If breakpoint n is not implemented then this register is unallocated.

**Attributes**

DBGWVR<n>_EL1 is a 64-bit register.

#### Field descriptions

The DBGWVR<n>_EL1 bit assignments are:

**RESS, bits [63:49]**

Reserved, Sign extended. Hardware and software must treat this field as RES0 if bit[48] is 0 or RES0, and as RES1 if bit[48] is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of bit [48], meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA, bits [48:2]**

Bits[48:2] of the address value for comparison.

ARM deprecates setting DBGWVR<n>_EL1[2] == 1.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Cold reset.

**Bits [1:0]**

Reserved, RES0.

## Accessing the DBGWVR<n>_EL1:

To access the DBGWVR<n>_EL1:

```
MRS <Xt>, DBGWVR<n>_EL1 ; Read DBGWVR<n>_EL1 into Xt, where n is in the range 0 to 15
MSR DBGWVR<n>_EL1, <Xt> ; Write Xt to DBGWVR<n>_EL1, where n is in the range 0 to 15
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0000 | n<3:0> | 110 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.13 DLR_EL0, Debug Link Register

The DLR_EL0 characteristics are:

**Purpose**

In Debug state, holds the address to restart from.

**Usage constraints**

This register is accessible as follows:

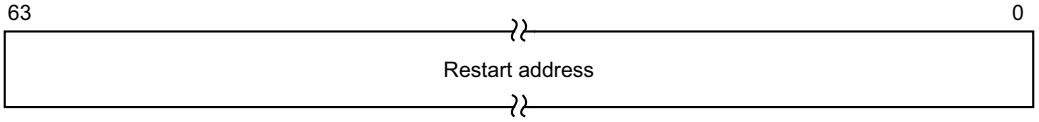
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

Access to this register is from Debug state only. During normal execution this register is unallocated.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



AArch64 System register DLR_EL0[31:0] is architecturally mapped to AArch32 System register DLR.

**Attributes**

DLR_EL0 is a 64-bit register.

#### Field descriptions

The DLR_EL0 bit assignments are:

**Bits [63:0]**

Restart address.

#### Accessing the DLR_EL0:

To access the DLR_EL0:

```
MRS <Xt>, DLR_EL0 ; Read DLR_EL0 into Xt
MSR DLR_EL0, <Xt> ; Write Xt to DLR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.14 DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

**Purpose**

Holds the saved process state on entry to Debug state.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RW | RW | RW | RW | RW | RW |

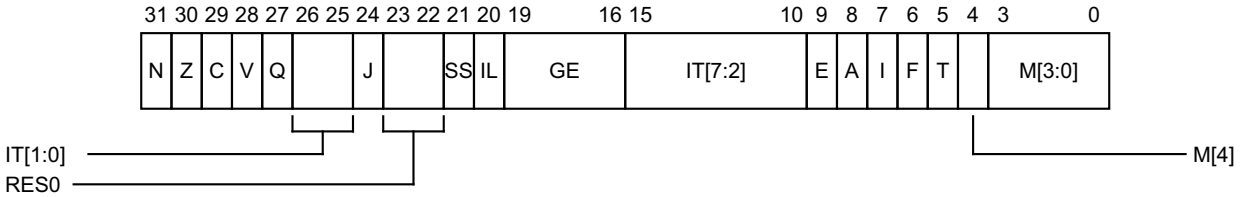
Access to this register is from Debug state only. During normal execution this register is unallocated.

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register DSPSR_EL0 is architecturally mapped to AArch32 System register DSPSR.



**Attributes**

DSPSR_EL0 is a 32-bit register.

#### Field descriptions

The DSPSR_EL0 bit assignments are:

***When exiting Debug state to AArch32:***

**N, bit [31]**

Copied to CPSR.N on exiting Debug state.

**Z, bit [30]**

Copied to CPSR.Z on exiting Debug state.

**C, bit [29]**

Copied to CPSR.C on exiting Debug state.

**V, bit [28]**

Copied to CPSR.V on exiting Debug state.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IT[1:0], bits [26:25]**

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**Bits [23:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is `0b00000000` when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

`0` Little-endian operation

`1` Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

Asynchronous data abort mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**T, bit [5]**

T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from. Possible values of this bit are:

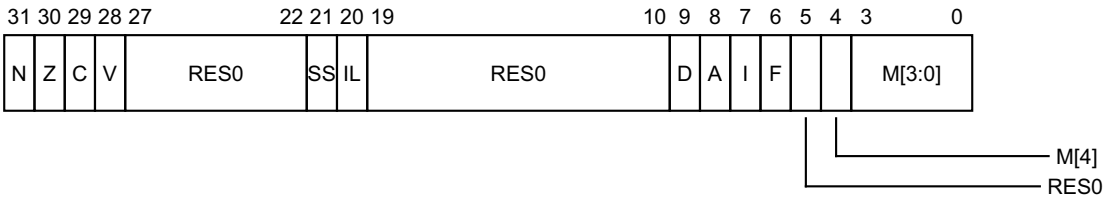
0 Taken from A32 state.

1 Taken from T32 state.

**M[4], bit [4]**

Execution state that Debug state was entered from. Possible values of this bit are:

1 Exception taken from AArch32.



**M[3:0], bits [3:0]**

AArch32 mode that Debug state was entered from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | User |
| 0b0001 | FIQ |
| 0b0010 | IRQ |
| 0b0011 | Supervisor |
| 0b0110 | Monitor |
| 0b0111 | Abort |
| 0b1010 | Hyp |
| 0b1011 | Undefined |
| 0b1111 | System |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-5501.

***When entering Debug state from AArch64 and exiting Debug state to AArch64:***

**N, bit [31]**

Set to the value of the N condition flag on entering Debug state, and copied to the N condition flag on exiting Debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Z, bit [30]**

Set to the value of the Z condition flag on entering Debug state, and copied to the Z condition flag on exiting Debug state.

**C, bit [29]**

Set to the value of the C condition flag on entering Debug state, and copied to the C condition flag on exiting Debug state.

**V, bit [28]**

Set to the value of the V condition flag on entering Debug state, and copied to the V condition flag on exiting Debug state.

**Bits [27:22]**

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

**Bits [19:10]**

Reserved, RES0.

**D, bit [9]**

Process state D mask. The possible values of this bit are:

`0` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are not masked.

`1` Debug exceptions from Watchpoint, Breakpoint, and Software step debug events targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

**A, bit [8]**

SError (System Error) mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

`0` Exception not masked.

`1` Exception masked.

**Bit [5]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**M[4], bit [4]**

Execution state that Debug state was entered from. Possible values of this bit are:

`0` Exception taken from AArch64.

**M[3:0], bits [3:0]**

AArch64 mode that Debug state was entered from. The possible values are:

| M[3:0] | Mode |
|---|---|
| 0b0000 | EL0t |
| 0b0100 | EL1t |
| 0b0101 | EL1h |
| 0b1000 | EL2t |
| 0b1001 | EL2h |
| 0b1100 | EL3t |
| 0b1101 | EL3h |

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[3:2] holds the Exception Level.
- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - — 0 means the SP is always SP0.
  - — 1 means the exception SP is determined by the EL.

### Accessing the DSPSR_EL0:

To access the DSPSR_EL0:

```
MRS <Xt>, DSPSR_EL0 ; Read DSPSR_EL0 into Xt
MSR DSPSR_EL0, <Xt> ; Write Xt to DSPSR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 0100 | 0101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.15 MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

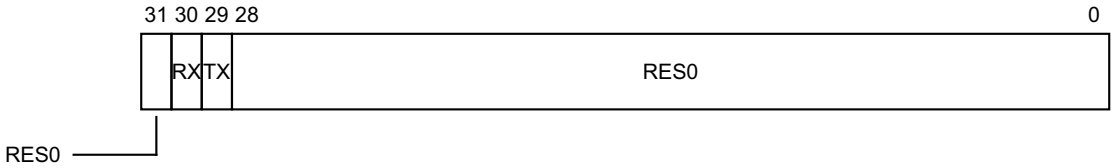
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**



AArch64 System register MDCCINT_EL1 is architecturally mapped to AArch32 System register DBGDCCINT.

**Attributes**

MDCCINT_EL1 is a 32-bit register.

#### Field descriptions

The MDCCINT_EL1 bit assignments are:

**Bit [31]**

Reserved, RES0.

**RX, bit [30]**

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

`0` No interrupt request generated by DTRRX.

`1` Interrupt request will be generated on RXfull == 1.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**TX, bit [29]**

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

`0` No interrupt request generated by DTRTX.

`1` Interrupt request will be generated on TXfull == 0.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

**Bits [28:0]**

Reserved, RES0.

## Accessing the MDCCINT_EL1:

To access the MDCCINT_EL1:

```
MRS <Xt>, MDCCINT_EL1 ; Read MDCCINT_EL1 into Xt
MSR MDCCINT_EL1, <Xt> ; Write Xt to MDCCINT_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0000 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.16 MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

**Purpose**

Main control register for the debug implementation, containing flow-control flags for the DCC. This is an internal, read-only view.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | RO | RO | RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

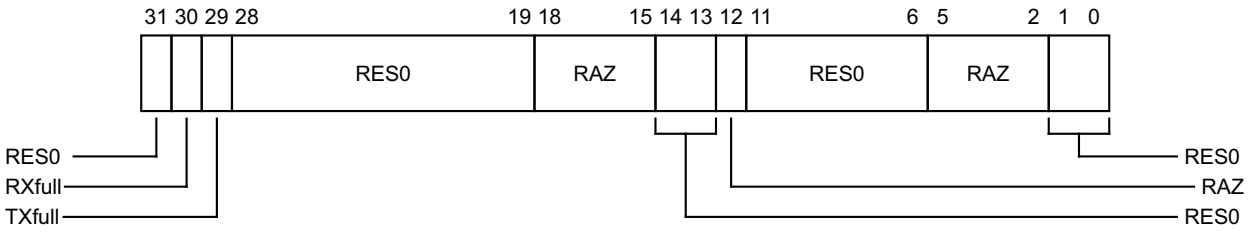
Subject to the prioritization rules:

If MDCR_EL2.TDA==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL0, EL1, and EL2 read accesses to this register are trapped to EL3.

If MDSCR_EL1.TDCC==1, EL0 read accesses to this register are trapped to EL1.

**Configurations**



AArch64 System register MDCCSR_EL0 is architecturally mapped to AArch32 System register DBGDSCRint.

**Attributes**

MDCCSR_EL0 is a 32-bit register.

#### Field descriptions

The MDCCSR_EL0 bit assignments are:

**Bit [31]**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Read-only view of the equivalent bit in the EDSCR.

**TXfull, bit [29]**

DTRTX full. Read-only view of the equivalent bit in the EDSCR.

**Bits [28:19]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [18:15]**

Reserved, RAZ. Hardware must implement this field as RAZ. Software must not rely on this field being RAZ.

**Bits [14:13]**

Reserved, RES0.

**Bit [12]**

Reserved, RAZ. Hardware must implement this field as RAZ. Software must not rely on this field being RAZ.

**Bits [11:6]**

Reserved, RES0.

**Bits [5:2]**

Reserved, RAZ. Hardware must implement this field as RAZ. Software must not rely on this field being RAZ.

**Bits [1:0]**

Reserved, RES0.

### Accessing the MDCCSR_EL0:

To access the MDCCSR_EL0:

```
MRS <Xt>, MDCCSR_EL0 ; Read MDCCSR_EL0 into Xt
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 011 | 0000 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.17 MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

**Purpose**

Provides EL2 configuration options for self-hosted debug and the Performance Monitors extension.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

**Traps and Enables**

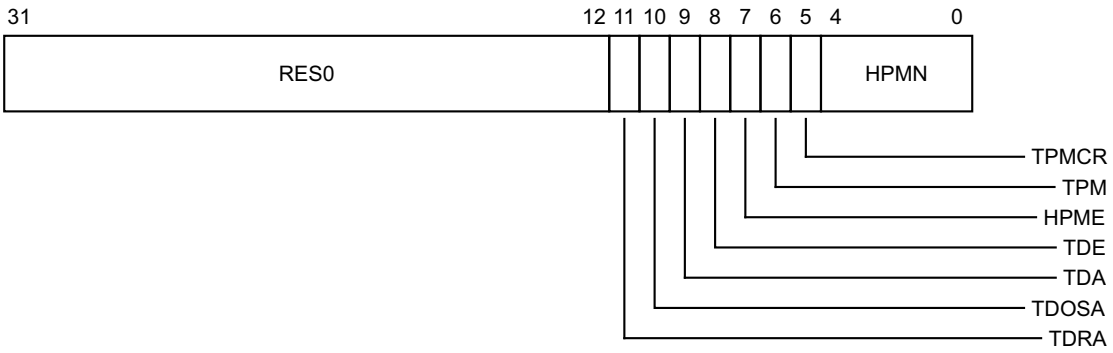
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL3.TDA==1, EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register MDCR_EL2 is architecturally mapped to AArch32 System register HDCR.



If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

MDCR_EL2 is a 32-bit register.

#### Field descriptions

The MDCR_EL2 bit assignments are:

**Bits [31:12]**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure System register accesses to the Debug ROM registers to EL2. This trap is from:

- Non-secure EL0 using AArch32.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- Non-secure EL1, regardless of which Execution state it is using.

0 Non-secure EL0 and EL1 System register accesses to the Debug ROM registers are not trapped to EL2.

1 Non-secure EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2.

The registers for which accesses are trapped are as follows:

AArch64: MDRAR_EL1.

AArch32: DBGDRAR, DBGDSAR.

If MDCR_EL2.TDE == 1 or HCR_EL2.TGE == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TDOSA, bit [10]**

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states:

0 Non-secure EL1 System register accesses to the powerdown debug registers are not trapped to EL2.

1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to EL2.

The registers for which accesses are trapped are as follows:

AArch64: OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and the DBGPRCR_EL1.

AArch32: DBGOSLSR, DBGOSLAR, DBGOSDLR, and the DBGPRCR.

AArch64 and AArch32:

- Any IMPLEMENTATION DEFINED integration registers.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

**Note**

These registers are not accessible at EL0.

If MDCR_EL2.TDE == 1 or HCR_EL2.TGE == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TDA, bit [9]**

Trap Debug Access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers that are not trapped by either of the following:

- MDCR_EL2.TDRA.
- MDCR_EL2.TDOSA.

0 Has no effect on System register accesses to the debug registers.

1 Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by MDCR_EL2.TDRA and MDCR_EL2.TDOSA, are trapped to EL2, from both Execution states.

MDCR_EL2.TDA does not trap accesses to the DBGDTRRX_EL0, DBGDTRTX_EL0, or DBGDTR_EL0 when the PE is in Debug state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If MDCR_EL2.TDE == 1 or HCR_EL2.TGE == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TDE, bit [8]**

Route Software debug exceptions from Non-secure EL1 and EL0 to EL2.

0 Has no effect on Debug exceptions.

1 Route Non-secure Debug exceptions from Non-secure EL1 and EL0 to EL2.

If HCR_EL2.TGE == 1, then this bit is ignored and treated as though it is 1 other than for the value read back from MDCR_EL2.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**HPME, bit [7]**

Hypervisor Performance Monitors Enable. The possible values of this bit are:

0 EL2 Performance Monitors disabled.

1 EL2 Performance Monitors enabled.

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from EL2 or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TPM, bit [6]**

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to EL2, from both Execution states:

0 Non-secure EL0 and EL1 accesses to all Performance Monitors registers are not trapped to EL2.

1 Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to EL2.

**Note**

- EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TPMCR, bit [5]**

Trap PMCR_EL0 or PMCR accesses. Traps Non-secure EL0 and EL1 accesses to the PMCR_EL0 or PMCR to EL2.

0 Non-secure EL0 and EL1 accesses to the PMCR_EL0 or PMCR are not trapped to EL2.

1 Non-secure EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

- EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**HPMN, bits [4:0]**

Defines the number of Performance Monitors counters that are accessible from Non-secure EL0 and EL1 modes.

If the Performance Monitors extension is not implemented, this field is RES0.

In Non-secure state, HPMN divides the Performance Monitors counters as follows. For counter n in Non-secure state:

- If n is in the range 0<=n<HPMN, the counter is accessible from EL1 and EL2, and from EL0 if permitted by PMUSERENR_EL0. PMCR_EL0.E enables the operation of counters in this range.
- If n is in the range HPMN<=n<PMCR_EL0.N, the counter is accessible only from EL2. MDCR_EL2.HPME enables the operation of counters in this range.

If this field is set to 0, or to a value larger than PMCR_EL0.N, then the following CONSTRAINED UNPREDICTABLE behavior applies:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than PMCR_EL0.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to the value of PMCR_EL0.N.

This field resets to its defined reset value on Warm reset.

## Accessing the MDCR_EL2:

To access the MDCR_EL2:

```
MRS <Xt>, MDCR_EL2 ; Read MDCR_EL2 into Xt
MSR MDCR_EL2, <Xt> ; Write Xt to MDCR_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 0001 | 0001 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.18 MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug and the Performance Monitors extension.

**Usage constraints**

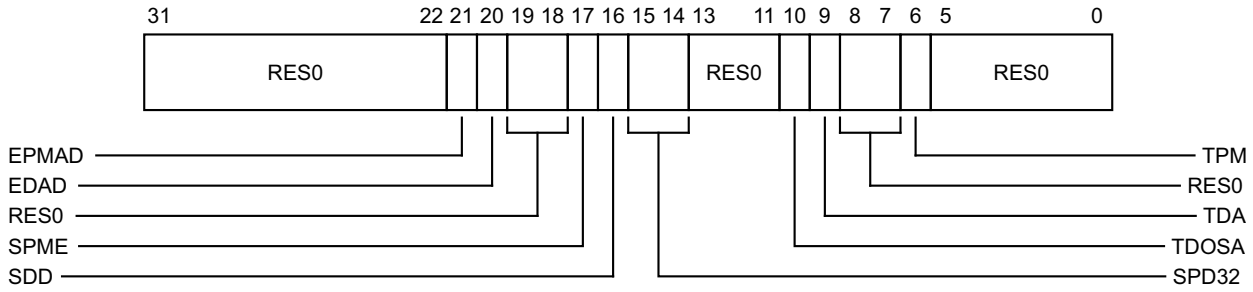
This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**



AArch64 System register MDCR_EL3 can be mapped to AArch32 System register SDCR, but this is not architecturally mandated.

**Attributes**

MDCR_EL3 is a 32-bit register.

## Field descriptions

The MDCR_EL3 bit assignments are:

**Bits [31:22]**

Reserved, RES0.

**EPMAD, bit [21]**

External debug interface Performance Monitors registers disable. This disables access to these registers by an external debugger:

0 Access to Performance Monitors registers from external debugger is permitted.

1 Access to Performance Monitors registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors extension is not implemented or does not support external debug interface accesses this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

This field resets to its defined reset value on Warm reset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EDAD, bit [20]**

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger:

0 Access to breakpoint and watchpoint registers from external debugger is permitted.

1 Access to breakpoint and watchpoint registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**Bits [19:18]**

Reserved, RES0.

**SPME, bit [17]**

Secure Performance Monitors enable. This allows event counting in Secure state:

0 Event counting prohibited in Secure state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

1 Event counting allowed in Secure state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.

This field resets to its defined reset value on Warm reset.

**SDD, bit [16]**

AArch64 Secure self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Software breakpoint instruction.

0 Debug exceptions from Secure EL0 are enabled, and debug exceptions from Secure EL1 are enabled if the value of MDSCR_EL1.KDE is 1 and the value of PSTATE.D is 0.

1 Software debug events, other than software breakpoint instruction debug events, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- Secure EL1 is using AArch64.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**SPD32, bits [15:14]**

AArch32 Secure self-hosted privileged invasive debug control. Enables or disables debug exceptions from Secure state if Secure EL1 is using AArch32, other than Software Breakpoint instructions. Valid values for this field are:

00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.

10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.

11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Software Breakpoint instructions. These are always enabled.

This field is:

- Ignored if either:
  - The PE is in Secure state.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

— Secure EL1 is using AArch64.

- RES0 if the implementation does not support EL1 using AArch32.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [13:11]**

Reserved, RES0.

**TDOSA, bit [10]**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3, from both Security states and both Execution states:

0 EL2 and EL1 System register accesses to the powerdown debug registers are not trapped to EL3.

1 EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3.

The registers for which accesses are trapped are as follows:

AArch64: OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1.

AArch32: DBGOSLAR, DBGOSLSR, DBGOSDLR, DBGPRCR.

AArch64 and AArch32:

- Any IMPLEMENTATION DEFINED integration registers.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TDA, bit [9]**

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field. When MDCR_EL3.TDA is:

0 EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are not trapped to EL3.

1 EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states.

MDCR_EL3.TDA does not trap accesses to the DBGDTRRX_EL0, DBGDTRTX_EL0, or DBGDTR_EL0 when the PE is in Debug state.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [8:7]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**TPM, bit [6]**

Trap Performance Monitors accesses. Traps EL2, EL1, and EL0 accesses to all Performance Monitors registers to EL3, from both Security states and both Execution states.

`0` EL2, EL1, and EL0 System register accesses to all Performance Monitors registers are not trapped to EL3.

`1` EL2, EL1, and EL0 System register accesses to all Performance Monitors registers are trapped to EL3.

If the Performance Monitors extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [5:0]**

Reserved, RES0.

## Accessing the MDCR_EL3:

To access the MDCR_EL3:

```
MRS <Xt>, MDCR_EL3 ; Read MDCR_EL3 into Xt
MSR MDCR_EL3, <Xt> ; Write Xt to MDCR_EL3
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 110 | 0001 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.19 MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. ARMv8 deprecates any use of this register.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RO | RO | RO | RO | RO |

ARMv8 deprecates any use of this register.

**Traps and Enables**

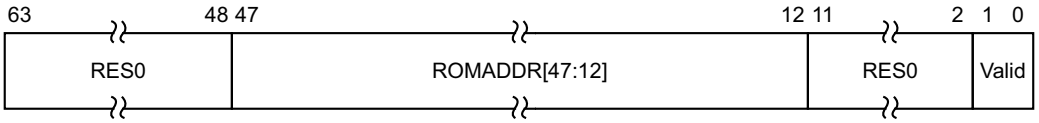
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TDRA==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 read accesses to this register are trapped to EL3.

**Configurations**



AArch64 System register MDRAR_EL1 is architecturally mapped to AArch32 System register DBGDRAR.

**Attributes**

MDRAR_EL1 is a 64-bit register.

#### Field descriptions

The MDRAR_EL1 bit assignments are:

**Bits [63:48]**

Reserved, RES0.

**ROMADDR[47:12], bits [47:12]**

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

ARM strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

**Bits [11:2]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Valid, bits [1:0]**

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

`00` ROM Table address is not valid

`11` ROM Table address is valid.

Other values are reserved.

If no memory-mapped debug components are implemented, this field is RES0.

### Accessing the MDRAR_EL1:

To access the MDRAR_EL1:

```
MRS <Xt>, MDRAR_EL1 ; Read MDRAR_EL1 into Xt
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0001 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.20 MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

**Purpose**

Main control register for the debug implementation.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

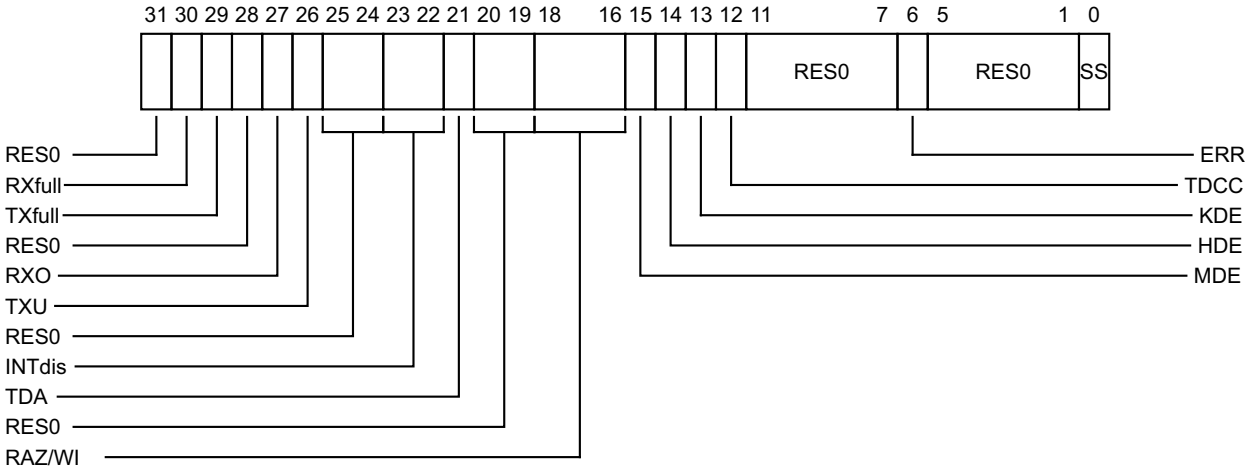
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**



AArch64 System register MDSCR_EL1 is architecturally mapped to AArch32 System register DBGDSCRext.

**Attributes**

MDSCR_EL1 is a 32-bit register.

#### Field descriptions

The MDSCR_EL1 bit assignments are:

**Bit [31]**

Reserved, RES0.

**RXfull, bit [30]**

Used for save/restore of EDSCR.RXfull.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW.

**TXfull, bit [29]**

Used for save/restore of EDSCR.TXfull.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of EDSCR.RXO.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW.

**TXU, bit [26]**

Used for save/restore of EDSCR.TXU.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW.

**Bits [25:24]**

Reserved, RES0.

**INTdis, bits [23:22]**

Used for save/restore of EDSCR.INTdis.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this field is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this field is RW.

**TDA, bit [21]**

Used for save/restore of EDSCR.TDA.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW.

**Bits [20:19]**

Reserved, RES0.

**Bits [18:16]**

Reserved, RAZ/WI. Hardware must implement this as RAZ/WI. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

**MDE, bit [15]**

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector catch debug exceptions.

`0` Breakpoint, Watchpoint, and Vector catch debug exceptions disabled.

`1` Breakpoint, Watchpoint, and Vector catch debug exceptions enabled.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This field resets to its defined reset value on Warm reset.

**HDE, bit [14]**

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW.

**KDE, bit [13]**

Local (kernel) debug enable. If $EL_D$ is using AArch64, enable Software debug events within $EL_D$. Permitted values are:

`0` Software debug events, other than Software breakpoint instructions, disabled within $EL_D$.

`1` Software debug events enabled within $EL_D$.

RES0 if $EL_D$ is using AArch32.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**TDCC, bit [12]**

Traps EL0 accesses to the DCC registers to EL1, from both Execution states:

`0` EL0 using AArch64: EL0 accesses to the MDCCSR_EL0, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0 registers are not trapped to EL1.
EL0 using AArch32: EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, and DBGDRAR registers are not trapped to EL1.

`1` EL0 using AArch64: EL0 accesses to the MDCCSR_EL0, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0 registers are trapped to EL1.
EL0 using AArch32: EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, and DBGDRAR registers are trapped to EL1.

**Note**

All accesses to these AArch32 registers are trapped, including LDC and STC accesses to DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of AArch32 PL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**Bits [11:7]**

Reserved, RES0.

**ERR, bit [6]**

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0 (the OS lock is unlocked), this bit is RO. Software must treat it as UNKNOWN and use an SBZP policy for writes.

When OSLSR_EL1.OSLK == 1 (the OS lock is locked), this bit is RW.

**Bits [5:1]**

Reserved, RES0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SS, bit [0]**

Software step control bit. If $EL_D$ is using AArch64, enable Software step. Permitted values are:

`0` Software step disabled

`1` Software step enabled.

RES0 if $EL_D$ is using AArch32.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

### Accessing the MDSCR_EL1:

To access the MDSCR_EL1:

```
MRS <Xt>, MDSCR_EL1 ; Read MDSCR_EL1 into Xt
MSR MDSCR_EL1, <Xt> ; Write Xt to MDSCR_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0000 | 0010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.21 OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

**Purpose**

Used to control the OS Double Lock.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

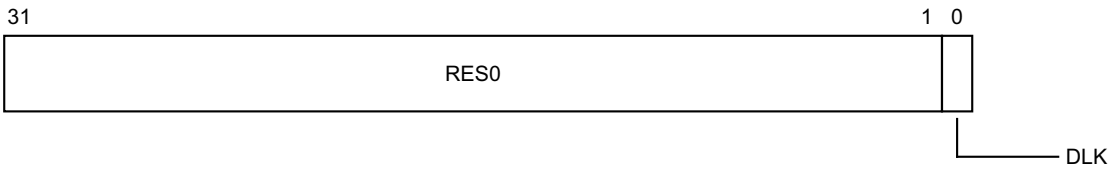
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TDOSA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDOSA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**



AArch64 System register OSDLR_EL1 is architecturally mapped to AArch32 System register DBGOSDLR.

**Attributes**

OSDLR_EL1 is a 32-bit register.

#### Field descriptions

The OSDLR_EL1 bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**DLK, bit [0]**

OS Double Lock control bit. Possible values are:

`0` OS Double Lock unlocked.

`1` OS Double Lock locked, if DBGPRCR_EL1.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

#### Accessing the OSDLR_EL1:

To access the OSDLR_EL1:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
MRS <Xt>, OSDLR_EL1 ; Read OSDLR_EL1 into Xt
MSR OSDLR_EL1, <Xt> ; Write Xt to OSDLR_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0001 | 0011 | 100 |

Non-Confidential - Beta

### D7.3.22 OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

**Purpose**

Used for save/restore of DBGDTRRX_EL0. It is a component of the Debug Communications Channel.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

ARM deprecates reads and writes of OSDTRRX_EL1 when the OS lock is unlocked.

**Traps and Enables**

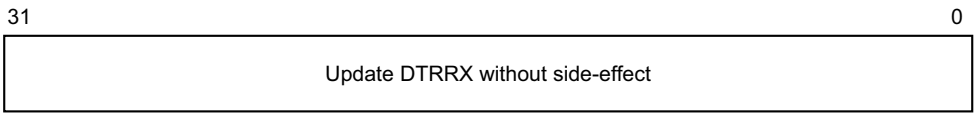
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**



AArch64 System register OSDTRRX_EL1 is architecturally mapped to AArch32 System register DBGDTRRXext.

**Attributes**

OSDTRRX_EL1 is a 32-bit register.

#### Field descriptions

The OSDTRRX_EL1 bit assignments are:

**Bits [31:0]**

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

#### Accessing the OSDTRRX_EL1:

To access the OSDTRRX_EL1:

```
MRS <Xt>, OSDTRRX_EL1 ; Read OSDTRRX_EL1 into Xt
MSR OSDTRRX_EL1, <Xt> ; Write Xt to OSDTRRX_EL1
```

### D7.3.23 OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX_EL1 characteristics are:

**Purpose**

Used for save/restore of DBGDTRTX_EL0. It is a component of the Debug Communications Channel.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

ARM deprecates reads and writes of OSDTRTX_EL1 when the OS lock is unlocked.

**Traps and Enables**

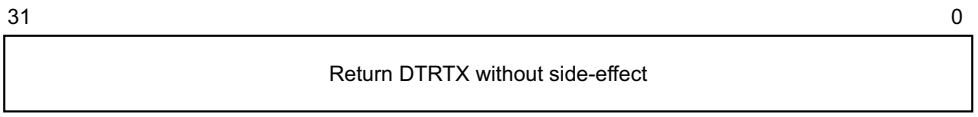
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**



AArch64 System register OSDTRTX_EL1 is architecturally mapped to AArch32 System register DBGDTRTXext.

**Attributes**

OSDTRTX_EL1 is a 32-bit register.

#### Field descriptions

The OSDTRTX_EL1 bit assignments are:

**Bits [31:0]**

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 *The Debug Communication Channel and Instruction Transfer Register*.

#### Accessing the OSDTRTX_EL1:

To access the OSDTRTX_EL1:

```
MRS <Xt>, OSDTRTX_EL1 ; Read OSDTRTX_EL1 into Xt
MSR OSDTRTX_EL1, <Xt> ; Write Xt to OSDTRTX_EL1
```

### D7.3.24 OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

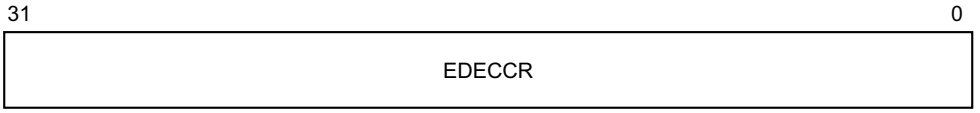
If MDCR_EL2.TDA==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TDA==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register OSECCR_EL1 is architecturally mapped to AArch32 System register DBGOSECCR.

AArch64 System register OSECCR_EL1 is architecturally mapped to External register EDECCR.



**Attributes**

OSECCR_EL1 is a 32-bit register.

#### Field descriptions

The OSECCR_EL1 bit assignments are:

***When OSLSR.OSLK==1:***

**EDECCR, bits [31:0]**

Used for save/restore to EDECCR over powerdown.

#### Accessing the OSECCR_EL1:

To access the OSECCR_EL1:

```
MRS <Xt>, OSECCR_EL1 ; Read OSECCR_EL1 into Xt
MSR OSECCR_EL1, <Xt> ; Write Xt to OSECCR_EL1
```

Non-Confidential - Beta

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0000 | 0110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.25 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS lock.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | WO | WO | WO | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

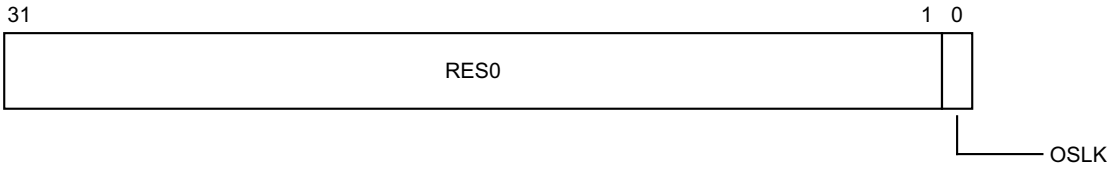
Subject to the prioritization rules:

If MDCR_EL2.TDOSA==1, Non-secure EL1 write accesses to this register are trapped to EL2.

If MDCR_EL3.TDOSA==1, EL1 and EL2 write accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register OSLAR_EL1 is architecturally mapped to AArch32 System register DBGOSLAR.



AArch64 System register OSLAR_EL1 is architecturally mapped to External register OSLAR_EL1.

**Attributes**

OSLAR_EL1 is a 32-bit register.

#### Field descriptions

The OSLAR_EL1 bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS lock.

Use OSLSR_EL1.OSLK to check the current status of the lock.

#### Accessing the OSLAR_EL1:

To access the OSLAR_EL1:

```
MSR OSLAR_EL1, <Xt> ; Write Xt to OSLAR_EL1
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0001 | 0000 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.26 OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

**Purpose**

Provides the status of the OS lock.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RO | RO | RO | RO | RO |

**Traps and Enables**

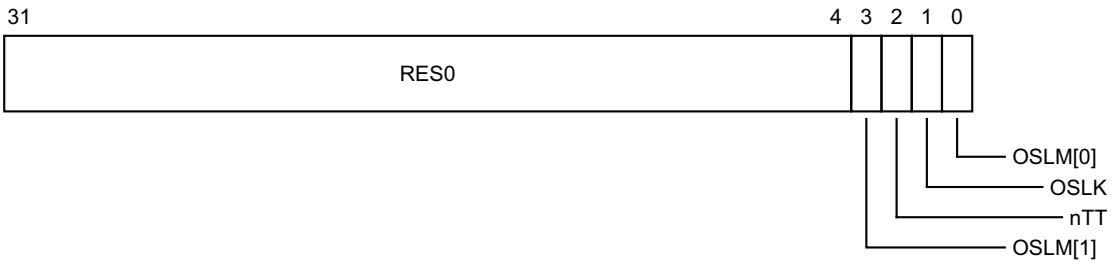
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TDOSA==1, Non-secure EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TDOSA==1, EL1 and EL2 read accesses to this register are trapped to EL3.

**Configurations**



AArch64 System register OSLSR_EL1 is architecturally mapped to AArch32 System register DBGOSLSR.

**Attributes**

OSLSR_EL1 is a 32-bit register.

#### Field descriptions

The OSLSR_EL1 bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**OSLM[1], bit [3]**

See below for description of the OSLM field.

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status. The possible values are:

0 OS lock unlocked.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 OS lock locked.

The OS lock is locked and unlocked by writing to the OS Lock Access Register.

When this register has an architecturally-defined reset value, this field resets to 1.

This field resets to its defined reset value on Cold reset.

**OSLM[0], bit [0]**

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented. In ARMv8 these bits are as follows:

10 OS lock implemented. DBGOSSRR not implemented.

All other values are reserved.

### Accessing the OSLSR_EL1:

To access the OSLSR_EL1:

```
MRS <Xt>, OSLSR_EL1 ; Read OSLSR_EL1 into Xt
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 10 | 000 | 0001 | 0001 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.3.27 SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Usage constraints**

This register is accessible as follows:

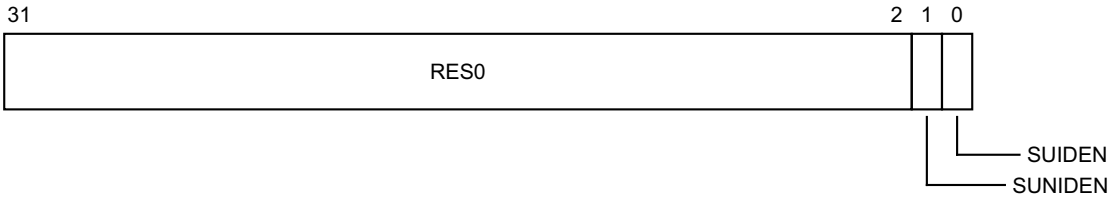
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | - | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register SDER32_EL3 is architecturally mapped to AArch32 System register SDER.



If EL1 is AArch64 only, this register is UNDEFINED.

**Attributes**

SDER32_EL3 is a 32-bit register.

#### Field descriptions

The SDER32_EL3 bit assignments are:

**Bits [31:2]**

Reserved, RES0.

**SUNIDEN, bit [1]**

Secure User Non-Invasive Debug Enable:

0 Performance Monitors event counting prohibited in Secure EL0 unless allowed by MDCR_EL3.SPME or the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

1 Performance Monitors event counting allowed in Secure EL0.

**SUIDEN, bit [0]**

Secure User Invasive Debug Enable:

0 Debug exceptions other than Software Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by MDCR_EL3.SPD32.

1 Debug exceptions from Secure EL0 are enabled.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the SDER32_EL3:

To access the SDER32_EL3:

```
MRS <Xt>, SDER32_EL3 ; Read SDER32_EL3 into Xt
MSR SDER32_EL3, <Xt> ; Write Xt to SDER32_EL3
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 110 | 0001 | 0001 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## D7.4 Performance Monitors registers

This section lists the Performance Monitoring registers in AArch64.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.1 PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to `0b11111`.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

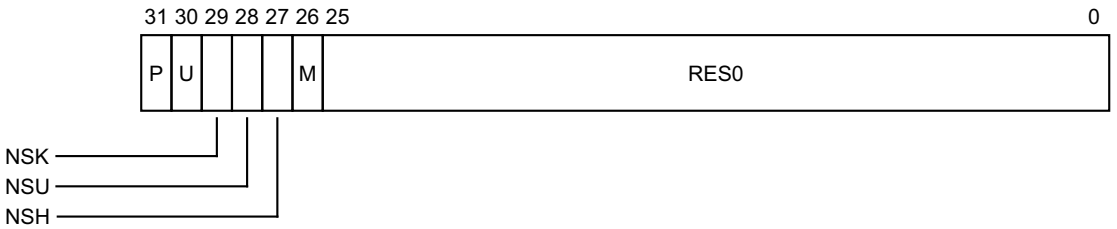
If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMCCFILTR_EL0 is architecturally mapped to AArch32 System register PMCCFILTR.

AArch64 System register PMCCFILTR_EL0 is architecturally mapped to External register PMCCFILTR_EL0.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

#### Field descriptions

The PMCCFILTR_EL0 bit assignments are:

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

`0` Count cycles in EL1.

`1` Do not count cycles in EL1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

0 Count cycles in EL0.

1 Do not count cycles in EL0.

**NSK, bit [29]**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0 Do not count cycles in EL2.

1 Count cycles in EL2.

**M, bit [26]**

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

**Bits [25:0]**

Reserved, RES0.

### Accessing the PMCCFILTR_EL0:

To access the PMCCFILTR_EL0:

```
MRS <Xt>, PMCCFILTR_EL0 ; Read PMCCFILTR_EL0 into Xt
MSR PMCCFILTR_EL0, <Xt> ; Write Xt to PMCCFILTR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 1111 | 111 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.2 PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D5-1858 for more information.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.CR==0, and PMUSERENR_EL0.EN==0, EL0 read accesses to this register are trapped to EL1.

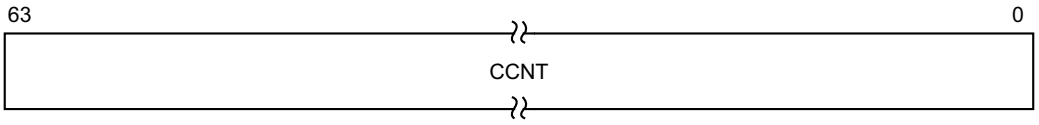
If PMUSERENR_EL0.EN==0, EL0 write accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMCCNTR_EL0 is architecturally mapped to AArch32 System register PMCCNTR.

AArch64 System register PMCCNTR_EL0 is architecturally mapped to External register PMCCNTR_EL0.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

#### Field descriptions

The PMCCNTR_EL0 bit assignments are:

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Writing 1 to PMCR_EL0.C sets this field to 0.

### Accessing the PMCCNTR_EL0:

To access the PMCCNTR_EL0:

```
MRS <Xt>, PMCCNTR_EL0 ; Read PMCCNTR_EL0 into Xt
MSR PMCCNTR_EL0, <Xt> ; Write Xt to PMCCNTR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1101 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.3 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | RO | RO | RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

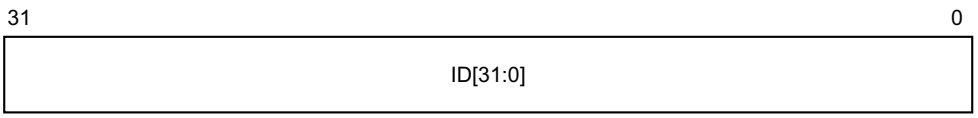
If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 read accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 read accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMCEID0_EL0 is architecturally mapped to AArch32 System register PMCEID0.



AArch64 System register PMCEID0_EL0 is architecturally mapped to External register PMCEID0_EL0.

**Attributes**

PMCEID0_EL0 is a 32-bit register.

#### Field descriptions

The PMCEID0_EL0 bit assignments are:

**ID[31:0], bits [31:0]**

PMCEID0_EL0[n] maps to event n. For a list of event numbers and descriptions, see *Events, Event numbers and mnemonics* on page D5-1872.

For each bit:

`0` The common event is not implemented.

`1` The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

### D7.4.4 PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | RO | RO | RO | RO | RO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

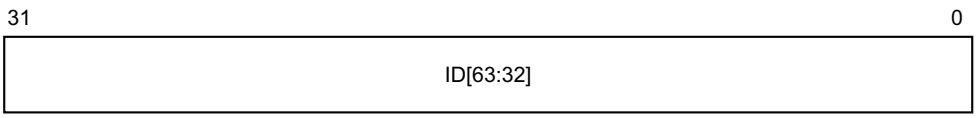
If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 read accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 read accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMCEID1_EL0 is architecturally mapped to AArch32 System register PMCEID1.



AArch64 System register PMCEID1_EL0 is architecturally mapped to External register PMCEID1_EL0.

**Attributes**

PMCEID1_EL0 is a 32-bit register.

#### Field descriptions

The PMCEID1_EL0 bit assignments are:

**ID[63:32], bits [31:0]**

PMCEID1_EL0[n] maps to event (n + 32). For a list of event numbers and descriptions, see *Events, Event numbers and mnemonics* on page D5-1872.

For each bit:

`0` The common event is not implemented.

`1` The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

### D7.4.5 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

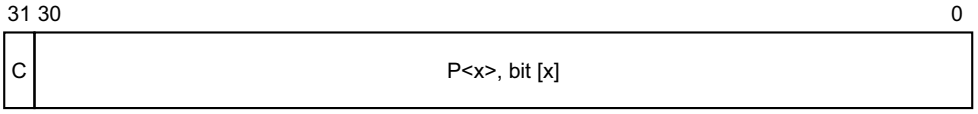
If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMCNTENCLR_EL0 is architecturally mapped to AArch32 System register PMCNTENCLR.

AArch64 System register PMCNTENCLR_EL0 is architecturally mapped to External register PMCNTENCLR_EL0.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCNTENCLR_EL0 is a 32-bit register.

#### Field descriptions

The PMCNTENCLR_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

`0` When read, means the cycle counter is disabled. When written, has no effect.

`1` When read, means the cycle counter is enabled. When written, disables the cycle counter.

**P<x>, bit [x], for x = 0 to 30**

Event counter disable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Possible values of each bit are:

0 When read, means that PMEVCNTR<x> is disabled. When written, has no effect.

1 When read, means that PMEVCNTR<x> is enabled. When written, disables PMEVCNTR<x>.

### Accessing the PMCNTENCLR_EL0:

To access the PMCNTENCLR_EL0:

```
MRS <Xt>, PMCNTENCLR_EL0 ; Read PMCNTENCLR_EL0 into Xt
MSR PMCNTENCLR_EL0, <Xt> ; Write Xt to PMCNTENCLR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1100 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.6 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

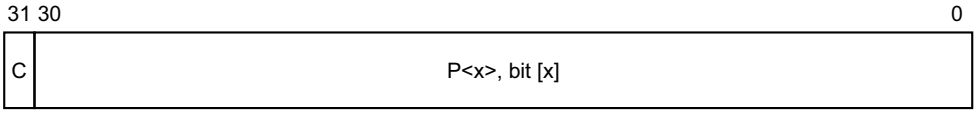
If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMCNTENSET_EL0 is architecturally mapped to AArch32 System register PMCNTENSET.

AArch64 System register PMCNTENSET_EL0 is architecturally mapped to External register PMCNTENSET_EL0.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

#### Field descriptions

The PMCNTENSET_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

`0` When read, means the cycle counter is disabled. When written, has no effect.

`1` When read, means the cycle counter is enabled. When written, enables the cycle counter.

**P<x>, bit [x], for x = 0 to 30**

Event counter enable bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Possible values of each bit are:

0 When read, means that PMEVCNTR<x> is disabled. When written, has no effect.

1 When read, means that PMEVCNTR<x> event counter is enabled. When written, enables PMEVCNTR<x>.

### Accessing the PMCNTENSET_EL0:

To access the PMCNTENSET_EL0:

```
MRS <Xt>, PMCNTENSET_EL0 ; Read PMCNTENSET_EL0 into Xt
MSR PMCNTENSET_EL0, <Xt> ; Write Xt to PMCNTENSET_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1100 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.7 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL2.TPMCR==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

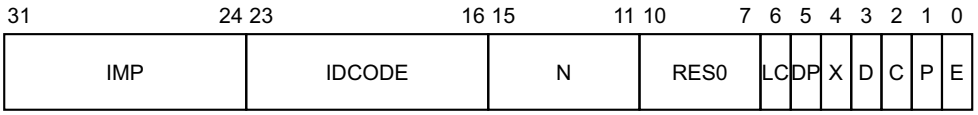
If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMCR_EL0 is architecturally mapped to AArch32 System register PMCR.

AArch64 System register PMCR_EL0[6:0] is architecturally mapped to External register PMCR_EL0[6:0].



Some or all RW fields of this register have defined reset values. These apply on Warm reset, and only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMCR_EL0 is a 32-bit register.

#### Field descriptions

The PMCR_EL0 bit assignments are:

**IMP, bits [31:24]**

Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.

The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the MIDR.

**IDCODE, bits [23:16]**

Identification code. This field is RO with an IMPLEMENTATION DEFINED value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

**N, bits [15:11]**

Number of event counters. A RO field that indicates the number counters implemented. The value of this field is the number of counters implemented, from `0b00000` for no counters to `0b11111` for 31 counters.

In an implementation that includes EL2, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of MDCR_EL2.HPMN.

An implementation can implement only the Cycle Count Register, PMCCNTR_EL0. This is indicated by a value of `0b00000` for the N field.

**Bits [10:7]**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines which PMCCNTR_EL0 bit generates an overflow recorded by PMOVSR[31].

`0` Cycle counter overflow on increment that changes PMCCNTR_EL0[31] from 1 to 0.

`1` Cycle counter overflow on increment that changes PMCCNTR_EL0[63] from 1 to 0.

ARM deprecates use of PMCR_EL0.LC = 0.

In an AArch64-only implementation, this field is RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**DP, bit [5]**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

`0` PMCCNTR_EL0, if enabled, counts when event counting is prohibited.

`1` PMCCNTR_EL0 does not count when event counting is prohibited.

Event counting is prohibited when ProfilingProhibited(IsSecure(),PSTATE.EL) == TRUE.

This bit is RW.

If EL3 is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**X, bit [4]**

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

`0` Do not export events.

`1` Export events where not prohibited.

This bit is used to permit events to be exported to another debug device, such as an OPTIONAL trace macrocell, over an event bus. If the implementation does not include such an event bus, this bit is RAZ/WI.

This bit does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If the implementation does not include an exported event stream, this bit is RAZ/WI. Otherwise this bit is RW.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**D, bit [3]**

Clock divider. The possible values of this bit are:

`0` When enabled, PMCCNTR_EL0 counts every clock cycle.

`1` When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

This bit is RW.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of PMCR.D = 1.

In an AArch64-only implementation, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**C, bit [2]**

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

`0` No action.

`1` Reset PMCCNTR_EL0 to zero.

This bit is always RAZ.

Resetting PMCCNTR_EL0 does not clear the PMCCNTR_EL0 overflow bit to 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**P, bit [1]**

Event counter reset. This bit is WO. The effects of writing to this bit are:

`0` No action.

`1` Reset all event counters accessible in the current EL, not including PMCCNTR_EL0, to zero.

This bit is always RAZ.

In Non-secure EL0 and EL1, if EL2 is implemented, a write of 1 to this bit does not reset event counters that MDCR_EL2.HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to its defined reset value on Warm reset.

**E, bit [0]**

Enable. The possible values of this bit are:

`0` All counters, including PMCCNTR_EL0, are disabled.

`1` All counters are enabled by PMCNTENSET_EL0.

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that MDCR_EL2.HPMN reserves for EL2 use.

When this register has an architecturally-defined reset value, this field resets to `0`.

This field resets to its defined reset value on Warm reset.

Non-Confidential - Beta

### Accessing the PMCR_EL0:

To access the PMCR_EL0:

```
MRS <Xt>, PMCR_EL0 ; Read PMCR_EL0 into Xt
MSR PMCR_EL0, <Xt> ; Write Xt to PMCR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1100 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.8 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSELR_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.ER==0, EL0 read accesses to this register are trapped to EL1.

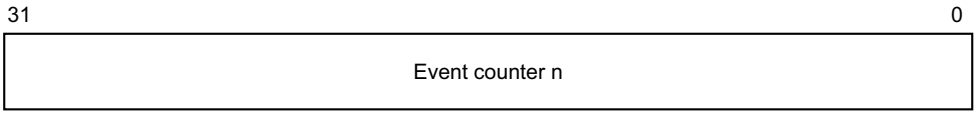
If PMUSERENR_EL0.EN==0, EL0 write accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMEVCNTR<n>_EL0 is architecturally mapped to AArch32 System register PMEVCNTR<n>.

AArch64 System register PMEVCNTR<n>_EL0 is architecturally mapped to External register PMEVCNTR<n>_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMEVCNTR<n>_EL0 is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The PMEVCNTR<n>_EL0 bit assignments are:

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

### Accessing the PMEVCNTR<n>_EL0:

To access the PMEVCNTR<n>_EL0:

```
MRS <Xt>, PMEVCNTR<n>_EL0 ; Read PMEVCNTR<n>_EL0 into Xt, where n is in the range 0 to 30
MSR PMEVCNTR<n>_EL0, <Xt> ; Write Xt to PMEVCNTR<n>_EL0, where n is in the range 0 to 30
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 10:n<4:3> | n<2:0> |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.9 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

PMEVTYPER<n>_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSELR_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

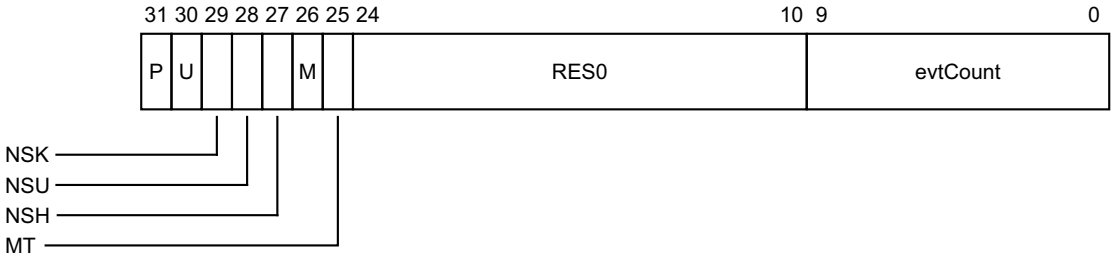
If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMEVTYPER<n>_EL0 is architecturally mapped to AArch32 System register PMEVTYPER<n>.

AArch64 System register PMEVTYPER<n>_EL0 is architecturally mapped to External register PMEVTYPER<n>_EL0.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMEVTYPER<n>_EL0 is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The PMEVTYPER<n>_EL0 bit assignments are:

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

`0` Count events in EL1.

`1` Do not count events in EL1.

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

`0` Count events in EL0.

`1` Do not count events in EL0.

**NSK, bit [29]**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

**NSU, bit [28]**

Non-secure User mode filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

**NSH, bit [27]**

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

`0` Do not count events in EL2.

`1` Count events in EL2.

**M, bit [26]**

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Secure EL3 are counted.

Otherwise, events in Secure EL3 are not counted.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**MT, bit [25]**

Multi-threading. If MPIDR_EL1.MT is set to 0, this bit is RES0. Otherwise valid values for this bit are:

0 Count events only on controlling PE.

1 Count events from any PE with the same affinity at level 1 and above as this PE.

**Note**

Events from a different thread of a multi-threaded implementation are not Attributable to the thread counting the event.

**Bits [24:10]**

Reserved, RES0.

**evtCount, bits [9:0]**

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event defined by the processor or a common event defined by the architecture.

If evtCount is programmed to an event that is reserved or not implemented, the behavior depends on the event type.

For common architectural and microarchitectural events:

- No events are counted.
- The value read back on evtCount is the value written.

For IMPLEMENTATION DEFINED events:

- It is UNPREDICTABLE what event, if any, is counted. UNPREDICTABLE in this case means the event must not expose privileged information.
- The value read back on evtCount is an UNKNOWN value with the same effect.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

## Accessing the PMEVTYPER<n>_EL0:

To access the PMEVTYPER<n>_EL0:

```
MRS <Xt>, PMEVTYPER<n>_EL0 ; Read PMEVTYPER<n>_EL0 into Xt, where n is in the range 0 to 30
MSR PMEVTYPER<n>_EL0, <Xt> ; Write Xt to PMEVTYPER<n>_EL0, where n is in the range 0 to 30
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 11:n<4:3> | n<2:0> |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.10 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

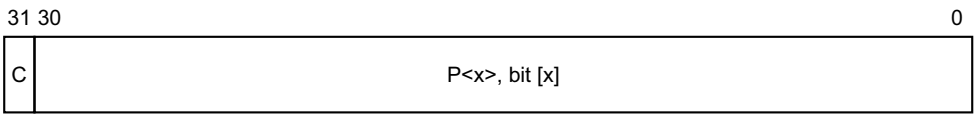
If MDCR_EL2.TPM==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register PMINTENCLR_EL1 is architecturally mapped to AArch32 System register PMINTENCLR.

AArch64 System register PMINTENCLR_EL1 is architecturally mapped to External register PMINTENCLR_EL1.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMINTENCLR_EL1 is a 32-bit register.

#### Field descriptions

The PMINTENCLR_EL1 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

`0` When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

`1` When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<x>_EL0.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Bits [30:N] are RAZ/WI.

Possible values are:

`0` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is disabled. When written, has no effect.

`1` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<x>_EL0 interrupt request.

### Accessing the PMINTENCLR_EL1:

To access the PMINTENCLR_EL1:

```
MRS <Xt>, PMINTENCLR_EL1 ; Read PMINTENCLR_EL1 into Xt
MSR PMINTENCLR_EL1, <Xt> ; Write Xt to PMINTENCLR_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 1001 | 1110 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.11 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

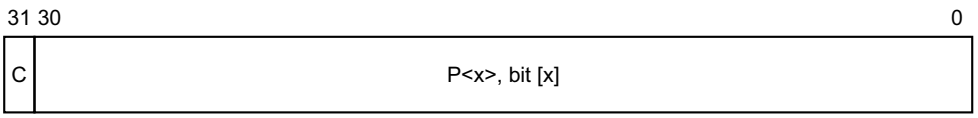
If MDCR_EL2.TPM==1, Non-secure EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL1 and EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register PMINTENSET_EL1 is architecturally mapped to AArch32 System register PMINTENSET.

AArch64 System register PMINTENSET_EL1 is architecturally mapped to External register PMINTENSET_EL1.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMINTENSET_EL1 is a 32-bit register.

#### Field descriptions

The PMINTENSET_EL1 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

`0` When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

`1` When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow interrupt request enable bit for PMEVCNTR<x>_EL0.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Bits [30:N] are RAZ/WI.

Possible values are:

`0` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is disabled. When written, has no effect.

`1` When read, means that the PMEVCNTR<x>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<x>_EL0 interrupt request.

### Accessing the PMINTENSET_EL1:

To access the PMINTENSET_EL1:

```
MRS <Xt>, PMINTENSET_EL1 ; Read PMINTENSET_EL1 into Xt
MSR PMINTENSET_EL1, <Xt> ; Write Xt to PMINTENSET_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 1001 | 1110 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.12 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<x>. Writing to this register clears these bits.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

This register is accessible at EL0 when PMUSERENR_EL0.EN is set to 1.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

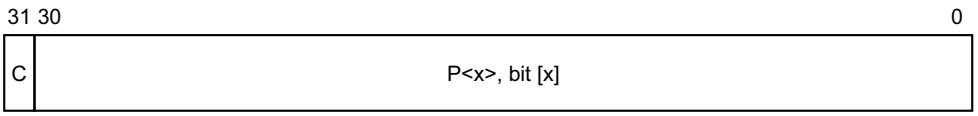
If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMOVSCLR_EL0 is architecturally mapped to AArch32 System register PMOVSR.

AArch64 System register PMOVSCLR_EL0 is architecturally mapped to External register PMOVSCLR_EL0.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMOVSCLR_EL0 is a 32-bit register.

## Field descriptions

The PMOVSCLR_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow bit. Possible values are:

`0` When read, means the cycle counter has not overflowed. When written, has no effect.

`1` When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

PMCR_EL0.LC is used to control from which bit of PMCCNTR_EL0 (bit 31 or bit 63) an overflow is detected.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow clear bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Possible values of each bit are:

`0` When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.

`1` When read, means that PMEVCNTR<x> has overflowed. When written, clears the PMEVCNTR<x> overflow bit to 0.

## Accessing the PMOVSCLR_EL0:

To access the PMOVSCLR_EL0:

```
MRS <Xt>, PMOVSCLR_EL0 ; Read PMOVSCLR_EL0 into Xt
MSR PMOVSCLR_EL0, <Xt> ; Write Xt to PMOVSCLR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1100 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.13 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<x>.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

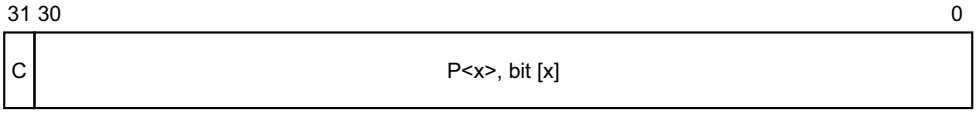
If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMOVSSET_EL0 is architecturally mapped to AArch32 System register PMOVSSET.

AArch64 System register PMOVSSET_EL0 is architecturally mapped to External register PMOVSSET_EL0.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMOVSSET_EL0 is a 32-bit register.

#### Field descriptions

The PMOVSSET_EL0 bit assignments are:

**C, bit [31]**

PMCCNTR_EL0 overflow bit. Possible values are:

`0` When read, means the cycle counter has not overflowed. When written, has no effect.

`1` When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

**P<x>, bit [x], for x = 0 to 30**

Event counter overflow set bit for PMEVCNTR<x>.

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Possible values are:

0 When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.

1 When read, means that PMEVCNTR<x> has overflowed. When written, sets the PMEVCNTR<x> overflow bit to 1.

### Accessing the PMOVSSET_EL0:

To access the PMOVSSET_EL0:

```
MRS <Xt>, PMOVSSET_EL0 ; Read PMOVSSET_EL0 into Xt
MSR PMOVSSET_EL0, <Xt> ; Write Xt to PMOVSSET_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1110 | 011 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.14 PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

**Purpose**

Selects the current event counter PMEVCNTR<x> or the cycle counter, CCNT.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

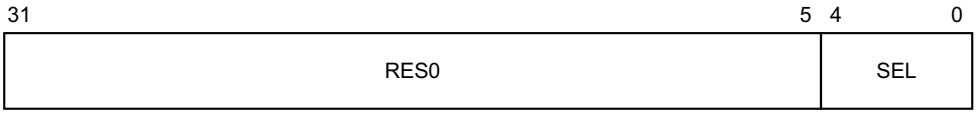
If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.ER==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMSELR_EL0 is architecturally mapped to AArch32 System register PMSELR.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMSELR_EL0 is a 32-bit register.

#### Field descriptions

The PMSELR_EL0 bit assignments are:

**Bits [31:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, PMEVCNTR<x>, where x is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111 it selects the cycle counter and:

- A read of the PMXEVTYPER_EL0 returns the value of PMCCFILTR_EL0.
- A write of the PMXEVTYPER_EL0 writes to PMCCFILTR_EL0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- A read or write of PMXEVCNTR_EL0 has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
  - Access to PMXEVCNTR_EL0 is UNDEFINED.
  - Access to PMXEVCNTR_EL0 behaves as a NOP.
  - Access to PMXEVCNTR_EL0 behaves as if the register is RAZ/WI.
  - Access to PMXEVCNTR_EL0 behaves as if the PMSELR_EL0.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31, the results of access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and can be one of the following:

- Access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 is UNDEFINED.
- Access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 behaves as a NOP.
- Access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 behaves as if the register is RAZ/WI.
- Access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 behaves as if the PMSELR_EL0.SEL field contains an UNKNOWN value.
- Access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 behaves as if the PMSELR_EL0.SEL field contains 0b11111.

### Accessing the PMSELR_EL0:

To access the PMSELR_EL0:

```
MRS <Xt>, PMSELR_EL0 ; Read PMSELR_EL0 into Xt
MSR PMSELR_EL0, <Xt> ; Write Xt to PMSELR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1100 | 101 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.15 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event `0x00`.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-WO | WO | WO | WO | WO | WO |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

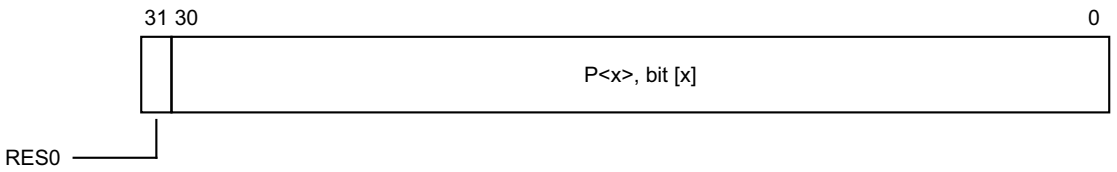
If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 write accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 write accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.SW==0, EL0 write accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMSWINC_EL0 is architecturally mapped to AArch32 System register PMSWINC.



AArch64 System register PMSWINC_EL0 is architecturally mapped to External register PMSWINC_EL0.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

#### Field descriptions

The PMSWINC_EL0 bit assignments are:

**Bit [31]**

Reserved, RES0.

**P<x>, bit [x], for x = 0 to 30**

Event counter software increment bit for PMEVCNTR<x>.

Bits [30:N] are WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR.N.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The effects of writing to this bit are:

0 No action. The write to this bit is ignored.

1 If PMEVCNTR<x> is enabled and configured to count the software increment event, increments PMEVCNTR<x> by 1. If PMEVCNTR<x> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

### Accessing the PMSWINC_EL0:

To access the PMSWINC_EL0:

```
MSR PMSWINC_EL0, <Xt> ; Write Xt to PMSWINC_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1100 | 100 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.16 PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

**Purpose**

Enables or disables EL0 access to the Performance Monitors.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| RO | RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

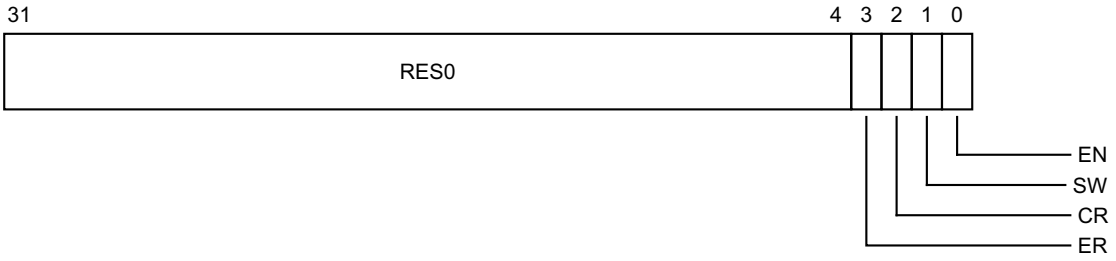
Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

**Configurations**

AArch64 System register PMUSERENR_EL0 is architecturally mapped to AArch32 System register PMUSERENR.



On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMUSERENR_EL0 is a 32-bit register.

#### Field descriptions

The PMUSERENR_EL0 bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**ER, bit [3]**

Event counter read trap control:

0 EL0 using AArch64: EL0 reads of the PMXEVCNTR_EL0 and PMEVCNTR<n>_EL0, and EL0 read/write accesses to the PMSELR_EL0, are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

EL0 using AArch32: EL0 reads of the PMXEVCNTR and PMEVCNTR<n>, and EL0 read/write accesses to the PMSELR, are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

1 EL0 using AArch64: EL0 reads of the PMXEVCNTR_EL0 and PMEVCNTR<n>_EL0, and EL0 read/write accesses to the PMSELR_EL0, are not trapped to EL1.

EL0 using AArch32: EL0 reads of the PMXEVCNTR and PMEVCNTR<n>, and EL0 read/write accesses to the PMSELR, are not trapped to EL1.

**CR, bit [2]**

Cycle counter read trap control:

0 EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

EL0 using AArch32: EL0 read accesses to the PMCCNTR are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

1 EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are not trapped to EL1.

EL0 using AArch32: EL0 read accesses to the PMCCNTR are not trapped to EL1.

**SW, bit [1]**

Software Increment write trap control:

0 EL0 using AArch64: EL0 writes to the PMSWINC_EL0 are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

EL0 using AArch32: EL0 writes to the PMSWINC are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

1 EL0 using AArch64: EL0 writes to the PMSWINC_EL0 are not trapped to EL1.

EL0 using AArch32: EL0 writes to the PMSWINC are not trapped to EL1.

**EN, bit [0]**

Traps EL0 accesses to the Performance Monitors registers to EL1, from both Execution states:

0 EL0 accesses to the Performance Monitors registers are trapped to EL1.

1 EL0 accesses to the Performance Monitors registers are not trapped to EL1. Software can access all PMU registers at EL0.

**Note**

- The PMUSERENR_EL0 and PMUSERENR registers are always RO at EL0 and not trapped by this bit.
- EL0 cannot read or write PMINTENSET_EL1 and PMINTENCLR_EL1, or PMINTENSET and PMINTENCLR.

### Accessing the PMUSERENR_EL0:

To access the PMUSERENR_EL0:

```
MRS <Xt>, PMUSERENR_EL0 ; Read PMUSERENR_EL0 into Xt
MSR PMUSERENR_EL0, <Xt> ; Write Xt to PMUSERENR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1110 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.17 PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, PMEVCNTR<x>_EL0. PMSELR_EL0.SEL determines which event counter is selected.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

If PMSELR_EL0.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_EL0.SEL is 31.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSELR_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

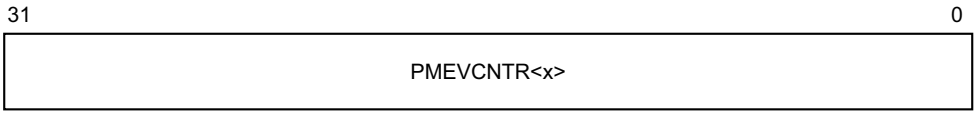
If PMUSERENR_EL0.EN==0, and PMUSERENR_EL0.ER==0, EL0 read accesses to this register are trapped to EL1.

If PMUSERENR_EL0.EN==0, EL0 write accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMXEVCNTR_EL0 is architecturally mapped to AArch32 System register PMXEVCNTR.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMXEVCNTR_EL0 is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The PMXEVCNTR_EL0 bit assignments are:

**PMEVCNTR<x>, bits [31:0]**

Value of the selected event counter, PMEVCNTR<x>_EL0, where x is the value stored in PMSELR_EL0.SEL.

### Accessing the PMXEVCNTR_EL0:

To access the PMXEVCNTR_EL0:

```
MRS <Xt>, PMXEVCNTR_EL0 ; Read PMXEVCNTR_EL0 into Xt
MSR PMXEVCNTR_EL0, <Xt> ; Write Xt to PMXEVCNTR_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1101 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.4.18 PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

**Purpose**

When PMSELR_EL0.SEL selects an event counter, this accesses a PMEVTYPER<n>_EL0 register. When PMSELR_EL0.SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

If PMSELR_EL0.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVTYPER_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_EL0.SEL is 31.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of PMUSERENR_EL0.EN is 1, if PMSELR_EL0.SEL is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If MDCR_EL2.TPM==1, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

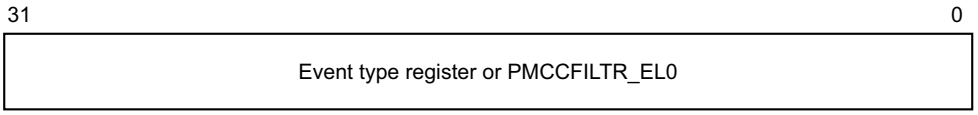
If MDCR_EL3.TPM==1, EL0, EL1, and EL2 accesses to this register are trapped to EL3.

If PMUSERENR_EL0.EN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register PMXEVTYPER_EL0 is architecturally mapped to AArch32 System register PMXEVTYPER.

On Warm reset, RW fields in this register reset to architecturally UNKNOWN values.



**Attributes**

PMXEVTYPER_EL0 is a 32-bit register.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Field descriptions

The PMXEVTYPER_EL0 bit assignments are:

**Bits [31:0]**

Event type register or PMCCFILTR_EL0.

When PMSELR_EL0.SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPER<n>_EL0 where n is the value in PMSELR_EL0.SEL.

### Accessing the PMXEVTYPER_EL0:

To access the PMXEVTYPER_EL0:

```
MRS <Xt>, PMXEVTYPER_EL0 ; Read PMXEVTYPER_EL0 into Xt
MSR PMXEVTYPER_EL0, <Xt> ; Write Xt to PMXEVTYPER_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1001 | 1101 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## D7.5 Generic Timer registers

This section lists the Generic Timer registers in AArch64.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### D7.5.1 CNTFRQ_EL0, Counter-timer Frequency register

The CNTFRQ_EL0 characteristics are:

**Purpose**

Holds the clock frequency of the system counter.

**Usage constraints**

If EL1 is the highest exception level implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 |
|---|---|
| Config-RO | RW |

If EL2 is the highest exception level implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 | EL2 (NS) |
|---|---|---|
| Config-RO | RO | RW |

If EL3 is implemented and is using AArch64, this register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | RO | RO | RO | RW | RW |

Can only be written at the highest Exception level implemented. For example, if EL3 is the highest implemented Exception level, CNTFRQ_EL0 can only be written at EL3.

**Traps and Enables**

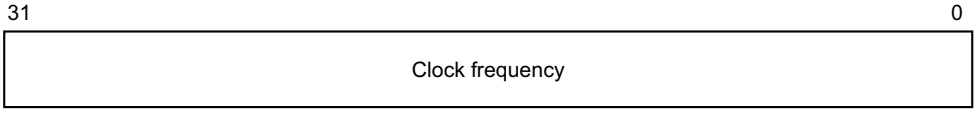
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CNTKCTL_EL1.EL0PCTEN==0, and CNTKCTL_EL1.EL0VCTEN==0, EL0 read accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register CNTFRQ_EL0 is architecturally mapped to AArch32 System register CNTFRQ.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTFRQ_EL0 is a 32-bit register.

#### Field descriptions

The CNTFRQ_EL0 bit assignments are:

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Bits [31:0]**

Clock frequency. Indicates the system counter clock frequency, in Hz.

### Accessing the CNTFRQ_EL0:

To access the CNTFRQ_EL0:

```
MRS <Xt>, CNTFRQ_EL0 ; Read CNTFRQ_EL0 into Xt
MSR CNTFRQ_EL0, <Xt> ; Write Xt to CNTFRQ_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 0000 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.2 CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 to the physical counter and the Non-secure EL1 physical timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

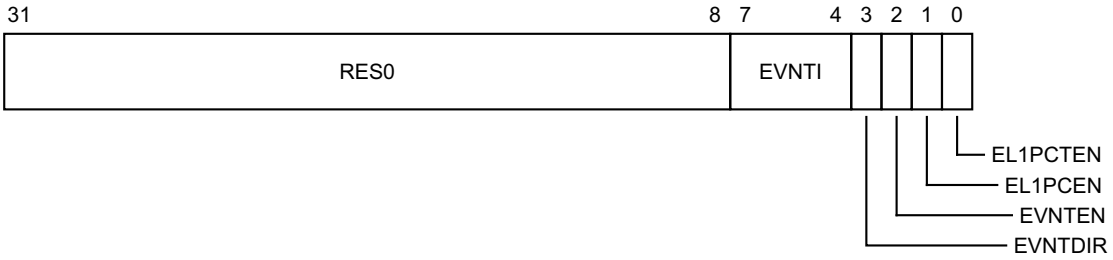
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register CNTHCTL_EL2 is architecturally mapped to AArch32 System register CNTHCTL.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHCTL_EL2 is a 32-bit register.

#### Field descriptions

The CNTHCTL_EL2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**EVNTI, bits [7:4]**

Selects which bit (0 to 15) of the corresponding counter register (CNTPCT_EL0 or CNTVCT_EL0) is the trigger for the event stream generated from that counter, when that stream is enabled.

**EVNTDIR, bit [3]**

Controls which transition of the counter register (CNTPCT_EL0 or CNTVCT_EL0) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0 A 0 to 1 transition of the trigger bit triggers an event.

1 A 1 to 0 transition of the trigger bit triggers an event.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EVNTEN, bit [2]**

Enables the generation of an event stream from the corresponding counter:

0 Disables the event stream.

1 Enables the event stream.

**EL1PCEN, bit [1]**

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2.
From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2.

1 From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are not trapped to EL2.
From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are not trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

**EL1PCTEN, bit [0]**

Traps Non-secure EL0 and EL1 accesses to the physical counter register to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2.
From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to EL2.

1 From AArch64 state: Non-secure EL0 and EL1 accesses to the CNTPCT_EL0 are not trapped to EL2.
From AArch32 state: Non-secure EL0 and EL1 accesses to the CNTPCT are not trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

### Accessing the CNTHCTL_EL2:

To access the CNTHCTL_EL2:

```
MRS <Xt>, CNTHCTL_EL2 ; Read CNTHCTL_EL2 into Xt
MSR CNTHCTL_EL2, <Xt> ; Write Xt to CNTHCTL_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 1110 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.3 CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP_CTL_EL2 characteristics are:

**Purpose**

Control register for the EL2 physical timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

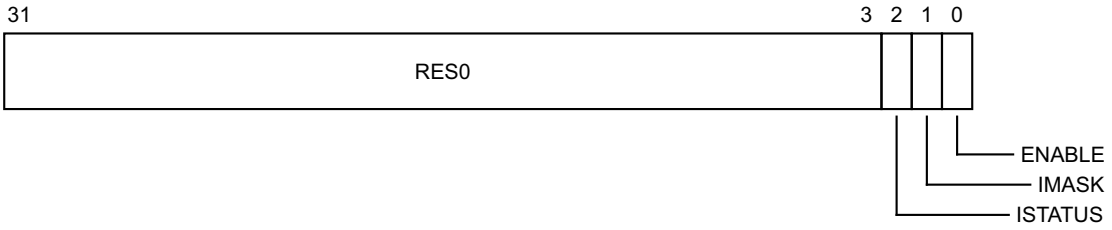
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register CNTHP_CTL_EL2 is architecturally mapped to AArch32 System register CNTHP_CTL.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_CTL_EL2 is a 32-bit register.

## Field descriptions

The CNTHP_CTL_EL2 bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

`0` Timer condition is not asserted.

`1` Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

0 Timer output signal is not masked.

1 Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0 Timer disabled.

1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TVAL_EL2 continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTHP_CTL_EL2:

To access the CNTHP_CTL_EL2:

```
MRS <Xt>, CNTHP_CTL_EL2 ; Read CNTHP_CTL_EL2 into Xt
MSR CNTHP_CTL_EL2, <Xt> ; Write Xt to CNTHP_CTL_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 1110 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.4 CNTHP_CVAL_EL2, Counter-timer Hypervisor Physical Timer CompareValue register

The CNTHP_CVAL_EL2 characteristics are:

**Purpose**

Holds the compare value for the EL2 physical timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | - |

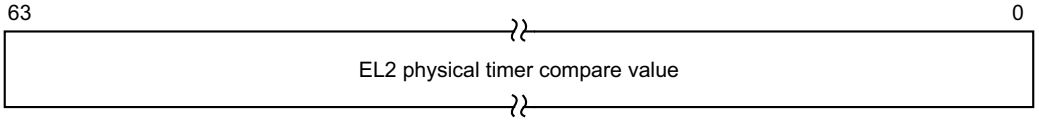
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register CNTHP_CVAL_EL2 is architecturally mapped to AArch32 System register CNTHP_CVAL.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_CVAL_EL2 is a 64-bit register.

#### Field descriptions

The CNTHP_CVAL_EL2 bit assignments are:

**Bits [63:0]**

EL2 physical timer compare value.

#### Accessing the CNTHP_CVAL_EL2:

To access the CNTHP_CVAL_EL2:

```
MRS <Xt>, CNTHP_CVAL_EL2 ; Read CNTHP_CVAL_EL2 into Xt
MSR CNTHP_CVAL_EL2, <Xt> ; Write Xt to CNTHP_CVAL_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 1110 | 0010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.5 CNTHP_TVAL_EL2, Counter-timer Hypervisor Physical Timer TimerValue register

The CNTHP_TVAL_EL2 characteristics are:

**Purpose**

Holds the timer value for the EL2 physical timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

Where the value of CNTHP_CTL_EL2.ENABLE is 0:

- A write to CNTHP_TVAL_EL2 updates the register
- The value held in CNTHP_TVAL_EL2 continues to decrement
- A read of CNTHP_TVAL_EL2 returns an UNKNOWN value.

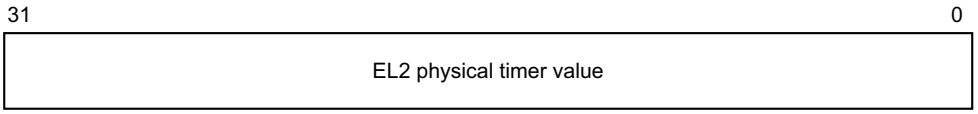
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register CNTHP_TVAL_EL2 is architecturally mapped to AArch32 System register CNTHP_TVAL.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTHP_TVAL_EL2 is a 32-bit register.

#### Field descriptions

The CNTHP_TVAL_EL2 bit assignments are:

**Bits [31:0]**

EL2 physical timer value.

#### Accessing the CNTHP_TVAL_EL2:

To access the CNTHP_TVAL_EL2:

```
MRS <Xt>, CNTHP_TVAL_EL2 ; Read CNTHP_TVAL_EL2 into Xt
MSR CNTHP_TVAL_EL2, <Xt> ; Write Xt to CNTHP_TVAL_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 1110 | 0010 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.6 CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

**Purpose**

Controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

**Usage constraints**

This register is accessible as follows:

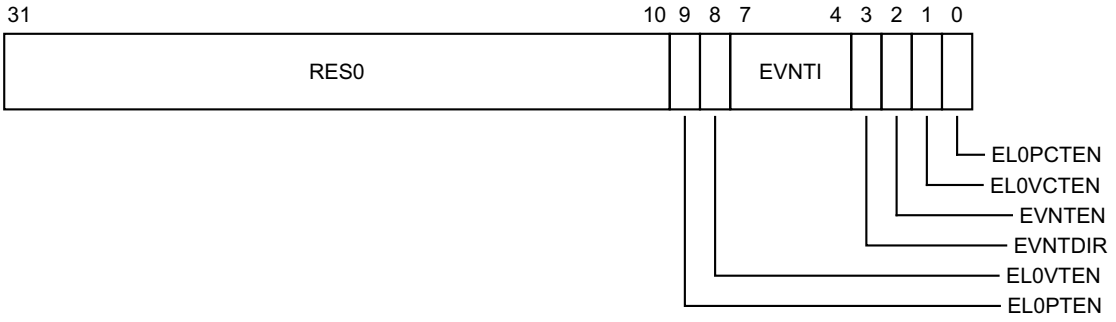
| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | RW | RW | RW | RW | RW |

**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register CNTKCTL_EL1 is architecturally mapped to AArch32 System register CNTKCTL.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTKCTL_EL1 is a 32-bit register.

#### Field descriptions

The CNTKCTL_EL1 bit assignments are:

**Bits [31:10]**

Reserved, RES0.

**EL0PTEN, bit [9]**

Traps EL0 accesses to the physical timer registers to EL1.

`0` EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 registers are trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to EL1.

`1` EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 registers are not trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are not trapped to EL1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**EL0VTEN, bit [8]**

Traps EL0 accesses to the virtual timer registers to EL1.

0 EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 registers are trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to EL1.

1 EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 registers are not trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are not trapped to EL1.

**EVNTI, bits [7:4]**

Selects which bit (0 to 15) of the corresponding counter register (CNTPCT_EL0 or CNTVCT_EL0) is the trigger for the event stream generated from that counter, when that stream is enabled.

**EVNTDIR, bit [3]**

Controls which transition of the counter register (CNTPCT_EL0 or CNTVCT_EL0) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0 A 0 to 1 transition of the trigger bit triggers an event.

1 A 1 to 0 transition of the trigger bit triggers an event.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the corresponding counter:

0 Disables the event stream.

1 Enables the event stream.

**EL0VCTEN, bit [1]**

Traps EL0 accesses to the frequency register and virtual counter register to Undefined mode.

0 EL0 using AArch64: EL0 accesses to the CNTVCT_EL0 are trapped to EL1.

EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL1, if CNTKCTL_EL1.EL0PCTEN is also 0.

EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTFRQ register are trapped to EL1, if CNTKCTL_EL1.EL0PCTEN is also 0.

1 EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 and CNTVCT_EL0 are not trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTFRQ and CNTVCT are not trapped to EL1.

**EL0PCTEN, bit [0]**

Traps EL0 accesses to the frequency register and physical counter register to EL1.

0 EL0 using AArch64: EL0 accesses to the CNTPCT_EL0 are trapped to EL1.

EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL1, if CNTKCTL_EL1.EL0VCTEN is also 0.

EL0 using AArch32: EL0 accesses to the CNTPCT are trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL1, if CNTKCTL_EL1.EL0VCTEN is also 0.

1 EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 and CNTPCT_EL0 are not trapped to EL1.

EL0 using AArch32: EL0 accesses to the CNTFRQ and CNTPCT are not trapped to EL1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Accessing the CNTKCTL_EL1:

To access the CNTKCTL_EL1:

```
MRS <Xt>, CNTKCTL_EL1 ; Read CNTKCTL_EL1 into Xt
MSR CNTKCTL_EL1, <Xt> ; Write Xt to CNTKCTL_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 000 | 1110 | 0001 | 000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.7 CNTP_CTL_EL0, Counter-timer Physical Timer Control register

The CNTP_CTL_EL0 characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

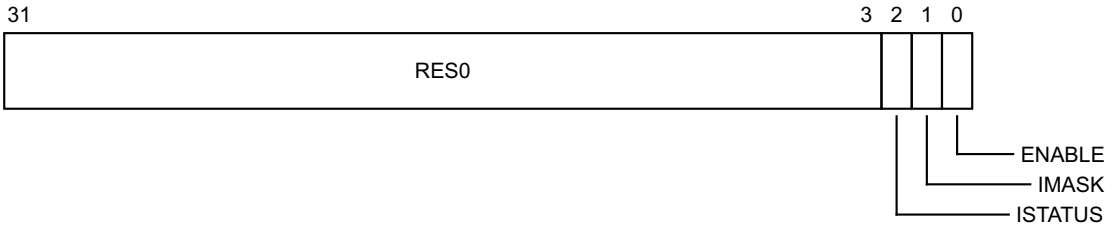
Subject to the prioritization rules:

If CNTHCTL_EL2.EL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If CNTKCTL_EL1.EL0PTEN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register CNTP_CTL_EL0 is architecturally mapped to AArch32 System register CNTP_CTL.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTP_CTL_EL0 is a 32-bit register.

#### Field descriptions

The CNTP_CTL_EL0 bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

`0` Timer condition is not asserted.

`1` Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

0 Timer output signal is not masked.

1 Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0 Timer disabled.

1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL_EL0 continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTP_CTL_EL0:

To access the CNTP_CTL_EL0:

```
MRS <Xt>, CNTP_CTL_EL0 ; Read CNTP_CTL_EL0 into Xt
MSR CNTP_CTL_EL0, <Xt> ; Write Xt to CNTP_CTL_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.8 CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL_EL0 characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

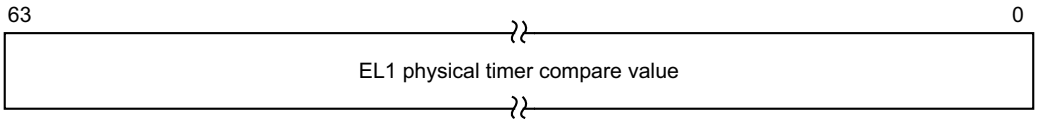
Subject to the prioritization rules:

If CNTHCTL_EL2.EL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If CNTKCTL_EL1.EL0PTEN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register CNTP_CVAL_EL0 is architecturally mapped to AArch32 System register CNTP_CVAL.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTP_CVAL_EL0 is a 64-bit register.

#### Field descriptions

The CNTP_CVAL_EL0 bit assignments are:

**Bits [63:0]**

EL1 physical timer compare value.

#### Accessing the CNTP_CVAL_EL0:

To access the CNTP_CVAL_EL0:

```
MRS <Xt>, CNTP_CVAL_EL0 ; Read CNTP_CVAL_EL0 into Xt
MSR CNTP_CVAL_EL0, <Xt> ; Write Xt to CNTP_CVAL_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 0010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.9 CNTP_TVAL_EL0, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL_EL0 characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | Config-RW | RW | RW | RW | RW |

Where the value of CNTP_CTL_EL0.ENABLE is 0:

- A write to CNTP_TVAL_EL0 updates the register
- The value held in CNTP_TVAL_EL0 continues to decrement
- A read of CNTP_TVAL_EL0 returns an UNKNOWN value.

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

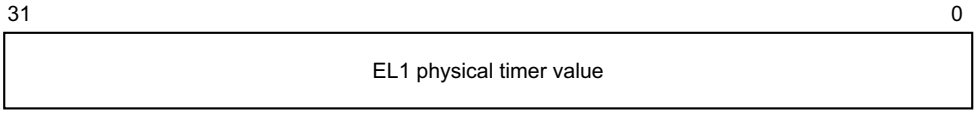
Subject to the prioritization rules:

If CNTHCTL_EL2.EL1PCEN==0, Non-secure EL0 and EL1 accesses to this register are trapped to EL2.

If CNTKCTL_EL1.EL0PTEN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register CNTP_TVAL_EL0 is architecturally mapped to AArch32 System register CNTP_TVAL.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTP_TVAL_EL0 is a 32-bit register.

#### Field descriptions

The CNTP_TVAL_EL0 bit assignments are:

**Bits [31:0]**

EL1 physical timer value.

#### Accessing the CNTP_TVAL_EL0:

To access the CNTP_TVAL_EL0:

```
MRS <Xt>, CNTP_TVAL_EL0 ; Read CNTP_TVAL_EL0 into Xt
MSR CNTP_TVAL_EL0, <Xt> ; Write Xt to CNTP_TVAL_EL0
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|

### D7.5.10 CNTPCT_EL0, Counter-timer Physical Count register

The CNTPCT_EL0 characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | Config-RO | RO | RO | RO | RO |

**Traps and Enables**

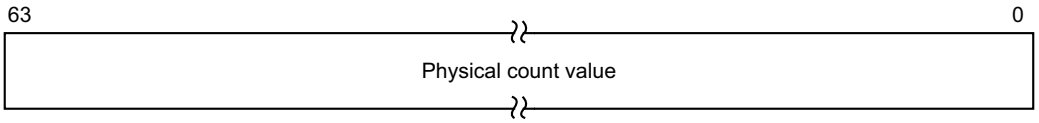
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CNTHCTL_EL2.EL1PCTEN==0, Non-secure EL0 and EL1 read accesses to this register are trapped to EL2.

If CNTKCTL_EL1.EL0PCTEN==0, EL0 read accesses to this register are trapped to EL1.

**Configurations**



AArch64 System register CNTPCT_EL0 is architecturally mapped to AArch32 System register CNTPCT.

**Attributes**

CNTPCT_EL0 is a 64-bit register.

#### Field descriptions

The CNTPCT_EL0 bit assignments are:

**Bits [63:0]**

Physical count value.

#### Accessing the CNTPCT_EL0:

To access the CNTPCT_EL0:

```
MRS <Xt>, CNTPCT_EL0 ; Read CNTPCT_EL0 into Xt
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 0000 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.11 CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

**Purpose**

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RW | - | RW | RW |

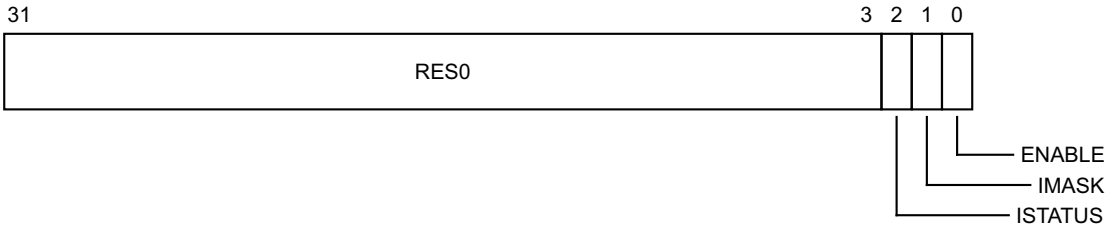
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If SCR_EL3.ST==0, Secure EL1 accesses to this register are trapped to EL3.

**Configurations**



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTPS_CTL_EL1 is a 32-bit register.

#### Field descriptions

The CNTPS_CTL_EL1 bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

`0` Timer condition is not asserted.

`1` Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

This bit is read-only.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

`0` Timer output signal is not masked.

`1` Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

`0` Timer disabled.

`1` Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTPS_TVAL_EL1 continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTPS_CTL_EL1:

To access the CNTPS_CTL_EL1:

```
MRS <Xt>, CNTPS_CTL_EL1 ; Read CNTPS_CTL_EL1 into Xt
MSR CNTPS_CTL_EL1, <Xt> ; Write Xt to CNTPS_CTL_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 111 | 1110 | 0010 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.12 CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

**Purpose**

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RW | - | RW | RW |

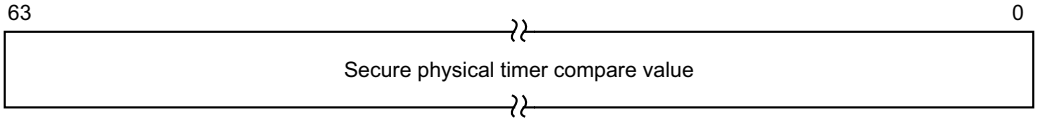
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If SCR_EL3.ST==0, Secure EL1 accesses to this register are trapped to EL3.

**Configurations**



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTPS_CVAL_EL1 is a 64-bit register.

#### Field descriptions

The CNTPS_CVAL_EL1 bit assignments are:

**Bits [63:0]**

Secure physical timer compare value.

#### Accessing the CNTPS_CVAL_EL1:

To access the CNTPS_CVAL_EL1:

```
MRS <Xt>, CNTPS_CVAL_EL1 ; Read CNTPS_CVAL_EL1 into Xt
MSR CNTPS_CVAL_EL1, <Xt> ; Write Xt to CNTPS_CVAL_EL1
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 111 | 1110 | 0010 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.13 CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS_TVAL_EL1 characteristics are:

**Purpose**

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | Config-RW | - | RW | RW |

Where the value of CNTPS_CTL_EL1.ENABLE is 0:

- A write to CNTPS_TVAL_EL1 updates the register
- The value held in CNTPS_TVAL_EL1 continues to decrement
- A read of CNTPS_TVAL_EL1 returns an UNKNOWN value.

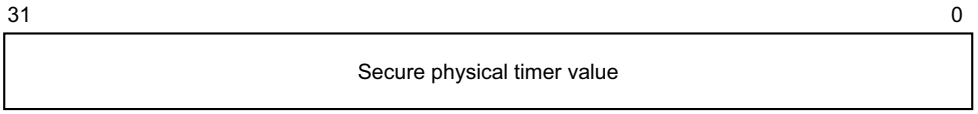
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If SCR_EL3.ST==0, Secure EL1 accesses to this register are trapped to EL3.

**Configurations**



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTPS_TVAL_EL1 is a 32-bit register.

#### Field descriptions

The CNTPS_TVAL_EL1 bit assignments are:

**Bits [31:0]**

Secure physical timer value.

#### Accessing the CNTPS_TVAL_EL1:

To access the CNTPS_TVAL_EL1:

```
MRS <Xt>, CNTPS_TVAL_EL1 ; Read CNTPS_TVAL_EL1 into Xt
MSR CNTPS_TVAL_EL1, <Xt> ; Write Xt to CNTPS_TVAL_EL1
```

### D7.5.14 CNTV_CTL_EL0, Counter-timer Virtual Timer Control register

The CNTV_CTL_EL0 characteristics are:

**Purpose**

Control register for the virtual timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

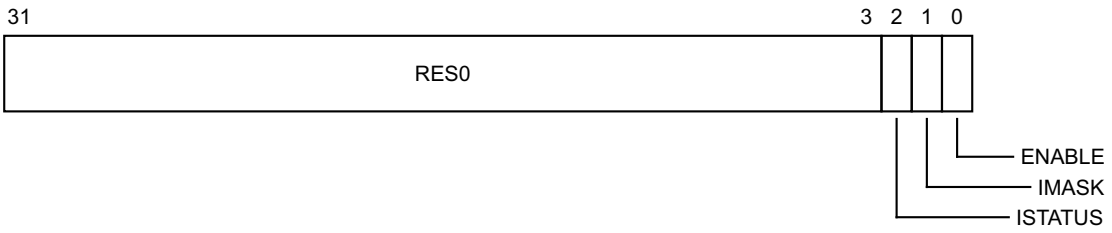
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CNTKCTL_EL1.EL0VTEN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register CNTV_CTL_EL0 is architecturally mapped to AArch32 System register CNTV_CTL.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_CTL_EL0 is a 32-bit register.

## Field descriptions

The CNTV_CTL_EL0 bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is asserted:

`0` Timer condition is not asserted.

`1` Timer condition is asserted.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer value meets the condition for the timer output to be asserted. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer output signal is asserted.

For more information see *Operation of the CompareValue views of the timers* on page D6-1904 and *Operation of the TimerValue views of the timers* on page D6-1904.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

This bit is read-only.

**IMASK, bit [1]**

Timer output signal mask bit. Permitted values are:

0 Timer output signal is not masked.

1 Timer output signal is masked.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0 Timer disabled.

1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL_EL0 continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTV_CTL_EL0:

To access the CNTV_CTL_EL0:

```
MRS <Xt>, CNTV_CTL_EL0 ; Read CNTV_CTL_EL0 into Xt
MSR CNTV_CTL_EL0, <Xt> ; Write Xt to CNTV_CTL_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 0011 | 001 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

### D7.5.15 CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL_EL0 characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

**Traps and Enables**

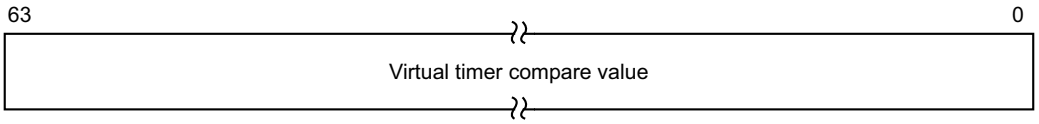
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CNTKCTL_EL1.EL0VTEN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register CNTV_CVAL_EL0 is architecturally mapped to AArch32 System register CNTV_CVAL.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_CVAL_EL0 is a 64-bit register.

#### Field descriptions

The CNTV_CVAL_EL0 bit assignments are:

**Bits [63:0]**

Virtual timer compare value.

#### Accessing the CNTV_CVAL_EL0:

To access the CNTV_CVAL_EL0:

```
MRS <Xt>, CNTV_CVAL_EL0 ; Read CNTV_CVAL_EL0 into Xt
MSR CNTV_CVAL_EL0, <Xt> ; Write Xt to CNTV_CVAL_EL0
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 0011 | 010 |

### D7.5.16 CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL_EL0 characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RW | RW | RW | RW | RW | RW |

Where the value of CNTV_CTL_EL0.ENABLE is 0:

- A write to CNTV_TVAL_EL0 updates the register
- The value held in CNTV_TVAL_EL0 continues to decrement
- A read of CNTV_TVAL_EL0 returns an UNKNOWN value.

**Traps and Enables**

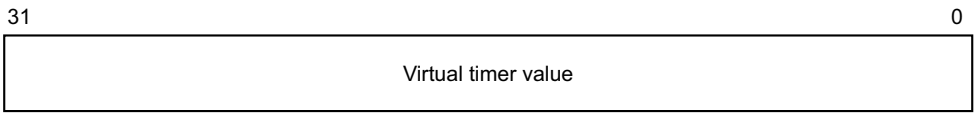
For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CNTKCTL_EL1.EL0VTEN==0, EL0 accesses to this register are trapped to EL1.

**Configurations**

AArch64 System register CNTV_TVAL_EL0 is architecturally mapped to AArch32 System register CNTV_TVAL.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTV_TVAL_EL0 is a 32-bit register.

#### Field descriptions

The CNTV_TVAL_EL0 bit assignments are:

**Bits [31:0]**

Virtual timer value.

#### Accessing the CNTV_TVAL_EL0:

To access the CNTV_TVAL_EL0:

```
MRS <Xt>, CNTV_TVAL_EL0 ; Read CNTV_TVAL_EL0 into Xt
MSR CNTV_TVAL_EL0, <Xt> ; Write Xt to CNTV_TVAL_EL0
```

### D7.5.17 CNTVCT_EL0, Counter-timer Virtual Count register

The CNTVCT_EL0 characteristics are:

**Purpose**

Holds the 64-bit virtual count value.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| Config-RO | RO | RO | RO | RO | RO |

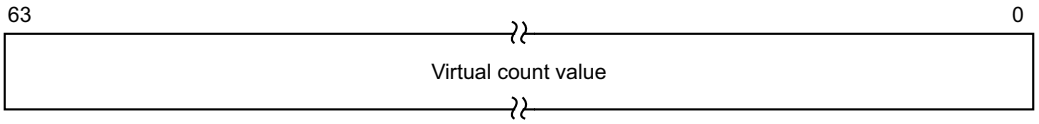
**Traps and Enables**

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1564.

Subject to the prioritization rules:

If CNTKCTL_EL1.EL0VCTEN==0, EL0 read accesses to this register are trapped to EL1.

**Configurations**



AArch64 System register CNTVCT_EL0 is architecturally mapped to AArch32 System register CNTVCT.

**Attributes**

CNTVCT_EL0 is a 64-bit register.

#### Field descriptions

The CNTVCT_EL0 bit assignments are:

**Bits [63:0]**

Virtual count value.

#### Accessing the CNTVCT_EL0:

To access the CNTVCT_EL0:

```
MRS <Xt>, CNTVCT_EL0 ; Read CNTVCT_EL0 into Xt
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 011 | 1110 | 0000 | 010 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### D7.5.18 CNTVOFF_EL2, Counter-timer Virtual Offset register

The CNTVOFF_EL2 characteristics are:

**Purpose**

Holds the 64-bit virtual offset.

**Usage constraints**

This register is accessible as follows:

| EL0 | EL1 (NS) | EL1 (S) | EL2 (NS) | EL3 (SCR.NS=1) | EL3 (SCR.NS=0) |
|---|---|---|---|---|---|
| - | - | - | RW | RW | RW |

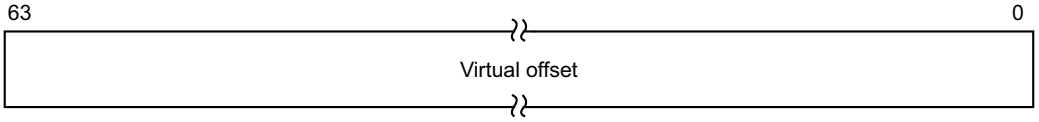
**Traps and Enables**

There are no traps or enables affecting this register.

**Configurations**

AArch64 System register CNTVOFF_EL2 is architecturally mapped to AArch32 System register CNTVOFF.

If EL2 is not implemented, this register is RES0 from EL3.



RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

CNTVOFF_EL2 is a 64-bit register.

#### Field descriptions

The CNTVOFF_EL2 bit assignments are:

**Bits [63:0]**

Virtual offset.

#### Accessing the CNTVOFF_EL2:

To access the CNTVOFF_EL2:

```
MRS <Xt>, CNTVOFF_EL2 ; Read CNTVOFF_EL2 into Xt
MSR CNTVOFF_EL2, <Xt> ; Write Xt to CNTVOFF_EL2
```

Register access is encoded as follows:

| op0 | op1 | CRn | CRm | op2 |
|---|---|---|---|---|
| 11 | 100 | 1110 | 0000 | 011 |

# Part E
## The AArch32 Application Level Architecture

# Chapter E1
# The AArch32 Application Level Programmers' Model

This chapter gives an Application level description of the programmers' model for software executing in AArch32 state. This means it describes execution in EL0 when EL0 is using AArch32. It contains the following sections:

- *About the Application level programmers' model* on page E1-2310.
- *Additional information about the programmers' model in AArch32 state* on page E1-2311.
- *Advanced SIMD and floating-point instructions* on page E1-2325.
- *Conceptual coprocessor support* on page E1-2353.
- *Exceptions* on page E1-2354.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## E1.1 About the Application level programmers' model

This chapter contains the programmers' model information required for the development of applications that will execute in AArch32 state.

The information in this chapter is distinct from the system information required to service and support application execution under an operating system, or higher level of system software. However, some knowledge of that system information is needed to put the Application level programmers' model into context.

Depending on the implementation, the architecture supports multiple levels of execution privilege. These privilege levels are indicated by different *Exception levels* that number upwards from EL0, where EL0 corresponds to the lowest privilege level and is often described as *unprivileged*. The Application level programmers' model is the programmers' model for software executing at EL0. For more information see *ARMv8 architectural concepts* on page A1-33.

System software determines the Exception level, and therefore the level of privilege, at which application software runs. When an operating system supports execution at both EL1 and EL0, an application usually runs unprivileged. This has the following effects:

- It means that the operating system can allocate system resources to an application in a unique or shared manner.
- It provides a degree of protection from other processes, and so helps protect the operating system from malfunctioning software.

This chapter indicates where some System level understanding is helpful, and if appropriate it gives a reference to the System level description.

When included in an implementation:

- EL3 provides two Security states, Secure and Non-secure. Secure state provides additional hardware features that support the development of secure applications.
- EL2 provides virtualization of operation in Non-secure state.

However, application level software is generally unaware of its Security state, and of any virtualization. For more information, see *The ARMv8-A security model* on page G1-3753 and *The effect of implementing EL2 on the Exception model* on page G1-3756.

**Note**

- When an implementation includes EL3, application and operating system software normally executes in Non-secure state.
- EL2, that provides the virtualization features, is implemented only in Non-secure state.
- Older documentation, describing implementations or architecture versions that support only two privilege levels, often refers to execution at EL1 as *privileged* execution.
- In this manual, the terms *CONSTRAINED UNPREDICTABLE*, *IMPLEMENTATION DEFINED*. *OPTIONAL*, *RES0*, *RES1*, *UNDEFINED*, *UNKNOWN*, and *UNPREDICTABLE* have ARM-specific meanings, as defined in the *Glossary*. In body text, these terms are shown in SMALL CAPS, for example IMPLEMENTATION DEFINED.

Non-Confidential - Beta

## E1.2 Additional information about the programmers' model in AArch32 state

The following sections give more information about the Application level programmers' model in AArch32 state:

- *Instruction sets, arithmetic operations, and register files*.
- *Core data types and arithmetic in AArch32 state*.
- *The general-purpose registers, and the PC, in AArch32 state* on page E1-2316.
- *Process state, PSTATE* on page E1-2319.

### E1.2.1 Instruction sets, arithmetic operations, and register files

The A32 and T32 instruction sets both provide a wide range of integer arithmetic and logical operations, that operate on a register file of sixteen 32-bit registers, that are comprised of the AArch32 general-purpose registers and the PC. As described in *The general-purpose registers, and the PC, in AArch32 state* on page E1-2316, these registers include the registers SP (R13) and LR (R14), which have specialized uses. *Core data types and arithmetic in AArch32 state* gives more information about these operations.

In addition, an implementation that implements the T32 and A32 instruction sets includes both:

- Scalar floating-point instructions.
- The Advanced SIMD vector instructions.

Floating-point and vector instructions operate on a separate common register file, described in *The SIMD and floating-point register file* on page E1-2325. *Advanced SIMD and floating-point instructions* on page E1-2325 gives more information about these instructions.

### E1.2.2 Core data types and arithmetic in AArch32 state

When executing in AArch32 state, a PE supports the following data types in memory:

**Byte** 8 bits
**Halfword** 16 bits
**Word** 32 bits
**Doubleword** 64 bits.

PE registers are 32 bits in size. The instruction sets provide instructions that use the following data types for data held in registers:

- 32-bit pointers.
- Unsigned or signed 32-bit integers.
- Unsigned 16-bit or 8-bit integers, held in zero-extended form.
- Signed 16-bit or 8-bit integers, held in sign-extended form.
- Two 16-bit integers packed into a register.
- Four 8-bit integers packed into a register.
- Unsigned or signed 64-bit integers held in two registers.

Load and store operations can transfer bytes, halfwords, or words to and from memory. Loads of bytes or halfwords zero-extend or sign-extend the data as it is loaded, as specified in the appropriate load instruction.

The instruction sets include load and store operations that transfer two or more words to and from memory. Software can load and store doublewords using these instructions.

**Note**

For information about the atomicity of memory accesses see *Atomicity in the ARM architecture* on page E2-2368.

When any of the data types is described as *unsigned*, the N-bit data value represents a non-negative integer in the range 0 to $2^N$-1, using normal binary format.

When any of these types is described as *signed*, the N-bit data value represents an integer in the range $-2^{(N-1)}$ to $+2^{(N-1)}$-1, using two's complement format.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The instructions that operate on packed halfwords or bytes include some multiply instructions that use only one of two halfwords, and SIMD instructions that perform parallel addition or subtraction on all of the halfwords or bytes.

**Note**

These SIMD instructions operate on values held in the general-purpose registers, and must not be confused with the Advanced SIMD instructions that operate on a separate register file that provides registers of up 128 bits.

Direct instruction support for 64-bit integers is limited, and most 64-bit operations require sequences of two or more instructions to synthesize them.

## Integer arithmetic

The instruction set provides a wide range of operations on the values in registers, including bitwise logical operations, shifts, additions, subtractions, multiplications, and divisions. The pseudocode described in Appendix K11 *ARM Pseudocode Definition* defines these operations, usually in one of three ways:

- By direct use of the pseudocode operators and built-in functions defined in *Operators* on page K11-5656.
- By use of pseudocode helper functions defined in the main text. See Appendix K12 *Pseudocode Index*.
- By a sequence of the form:
  1. Use of the `SInt()`, `UInt()`, and `Int()` built-in functions defined in *Converting bitstrings to integers* on page K11-5669 to convert the bitstring contents of the instruction operands to the unbounded integers that they represent as two's complement or unsigned integers.
  2. Use of mathematical operators, built-in functions and helper functions on those unbounded integers to calculate other such integers.
  3. Use of either the bitstring extraction operator defined in *Bitstring concatenation and slicing* on page K11-5657 or of the saturation helper functions described in *Pseudocode description of saturation* on page E1-2315 to convert an unbounded integer result into a bitstring result that can be written to a register.

### *Shift and rotate operations*

The following types of shift and rotate operations are used in instructions:

**Logical Shift Left**

(`LSL`) moves each bit of a bitstring left by a specified number of bits. Zeros are shifted in at the right end of the bitstring. Bits that are shifted off the left end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

**Logical Shift Right**

(`LSR`) moves each bit of a bitstring right by a specified number of bits. Zeros are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

**Arithmetic Shift Right**

(`ASR`) moves each bit of a bitstring right by a specified number of bits. Copies of the leftmost bit are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

**Rotate Right** (`ROR`) moves each bit of a bitstring right by a specified number of bits. Each bit that is shifted off the right end of the bitstring is re-introduced at the left end. The last bit shifted off the right end of the bitstring can be produced as a carry output.

**Rotate Right with Extend**

(`RRX`) moves each bit of a bitstring right by one bit. A carry input is shifted in at the left end of the bitstring. The bit shifted off the right end of the bitstring can be produced as a carry output.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### *Pseudocode description of shift and rotate operations*

These shift and rotate operations are supported in pseudocode by the following functions:

```
// LSL_C()
// =======

(bits(N), bit) LSL_C(bits(N) x, integer shift)
    assert shift > 0;
    extended_x = x : Zeros(shift);
    result = extended_x<N-1:0>;
    carry_out = extended_x<N>;
    return (result, carry_out);

// LSL()
// =====

bits(N) LSL(bits(N) x, integer shift)
    assert shift >= 0;
    if shift == 0 then
        result = x;
    else
        (result, -) = LSL_C(x, shift);
    return result;

// LSR_C()

### *Pseudocode description of addition and subtraction*

In pseudocode, addition and subtraction can be performed on any combination of unbounded integers and bitstrings, provided that if they are performed on two bitstrings, the bitstrings must be identical in length. The result is another unbounded integer if both operands are unbounded integers, and a bitstring of the same length as the bitstring operand or operands otherwise. For the definition of these operations, see *Addition and subtraction* on page K11-5658.

The main addition and subtraction instructions can produce status information about both unsigned carry and signed overflow conditions. When necessary, multi-word additions and subtractions can be synthesized from this status information. In pseudocode the `AddWithCarry()` function provides an addition with a carry input and a set of output Condition flags including carry output and overflow:

```
// AddWithCarry()
// ==============
// Integer addition with carry input, returning result and NZCV flags

(bits(N), bits(4)) AddWithCarry(bits(N) x, bits(N) y, bit carry_in)
    integer unsigned_sum = UInt(x) + UInt(y) + UInt(carry_in);
    integer signed_sum = SInt(x) + SInt(y) + UInt(carry_in);
    bits(N) result = unsigned_sum<N-1:0>; // same value as signed_sum<N-1:0>
    bit n = result<N-1>;
    bit z = if IsZero(result) then '1' else '0';
    bit c = if UInt(result) == unsigned_sum then '0' else '1';
    bit v = if SInt(result) == signed_sum then '0' else '1';
    return (result, n:z:c:v);
```

An important property of the `AddWithCarry()` function is that if:

```
(result, nzcv) = AddWithCarry(x, NOT(y), carry_in)
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Then:

- If `carry_in == '1'`, then `result == x-y` with:
  - `nzcv<0> == '1'` if signed overflow occurred during the subtraction.
  - `nzcv<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if x≥y.
- If `carry_in == '0'`, then `result == x-y-1` with:
  - `nzcv<0> == '1'` if signed overflow occurred during the subtraction.
  - `nzcv<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if x≥y.

Taken together, this means that the `carry_in` and `nzcv<1>` output in `AddWithCarry()` calls can act as NOT borrow flags for subtractions as well as carry flags for additions.

### *Pseudocode description of saturation*

Some instructions perform *saturating arithmetic*, that is, if the result of the arithmetic overflows the destination signed or unsigned N-bit integer range, the result produced is the largest or smallest value in that range, rather than wrapping around modulo $2^N$. This is supported in pseudocode by:

- The `SignedSatQ()` and `UnsignedSatQ()` functions when an operation requires, in addition to the saturated result, a Boolean argument that indicates whether saturation occurred.
- The `SignedSat()` and `UnsignedSat()` functions when only the saturated result is required.

```
// SignedSatQ()
// ============

(bits(N), boolean) SignedSatQ(integer i, integer N)
    if i > 2^(N-1) - 1 then
        result = 2^(N-1) - 1;  saturated = TRUE;
    elsif i < -(2^(N-1)) then
        result = -(2^(N-1));  saturated = TRUE;
    else
        result = i;  saturated = FALSE;
    return (result<N-1:0>, saturated);

// UnsignedSatQ()
// ==============

(bits(N), boolean) UnsignedSatQ(integer i, integer N)
    if i > 2^N - 1 then
        result = 2^N - 1;  saturated = TRUE;
    elsif i < 0 then
        result = 0;  saturated = TRUE;
    else
        result = i;  saturated = FALSE;
    return (result<N-1:0>, saturated);

// SignedSat()
// ===========

bits(N) SignedSat(integer i, integer N)
    (result, -) = SignedSatQ(i, N);
    return result;

// UnsignedSat()
// =============

bits(N) UnsignedSat(integer i, integer N)
    (result, -) = UnsignedSatQ(i, N);
    return result;
```

`SatQ(i, N, unsigned)` returns either `UnsignedSatQ(i, N)` or `SignedSatQ(i, N)` depending on the value of its third argument, and `Sat(i, N, unsigned)` returns either `UnsignedSat(i, N)` or `SignedSat(i, N)` depending on the value of its third argument:

```
// SatQ()
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
// ======

(bits(N), boolean) SatQ(integer i, integer N, boolean unsigned)
    (result, sat) = if unsigned then UnsignedSatQ(i, N) else SignedSatQ(i, N);
    return (result, sat);

// Sat()
// =====

bits(N) Sat(integer i, integer N, boolean unsigned)
    result = if unsigned then UnsignedSat(i, N) else SignedSat(i, N);
    return result;
```

### E1.2.3 The general-purpose registers, and the PC, in AArch32 state

In the AArch32 Application level view, a PE has:

- Fifteen general-purpose 32-bit registers, R0 to R14, of which R13 and R14 have alternative names reflecting how they are, or can be, used:
  - R13 is usually identified as SP.
  - R14 is usually identified as LR.
- The PC (*program counter*), that can be described as R15.

The specialized uses of the SP (R13), LR (R14), and PC (R15) are:

**SP, the stack pointer**

The PE uses SP as a pointer to the active stack.

In the T32 instruction set, some instructions cannot access SP, and for most T32 instructions ARM deprecates using SP as a general-purpose register. The only T32 instructions for which the use of SP is not deprecated are those designed to use SP as a stack pointer.

The A32 instruction set provides more general access to the SP, and it can be used as a general-purpose register. However, ARM deprecates the use of SP for any purpose other than as a stack pointer.

**Note**

- Using SP for any purpose other than as a stack pointer is likely to break the requirements of operating systems, debuggers, and other software systems, causing them to malfunction.
- Before ARMv8, for most T32 instructions, using SP as a general-purpose register was UNPREDICTABLE. In ARMv8, most of these uses of SP behave predictably, but are deprecated by ARM. The instruction descriptions give more information.

Software can refer to SP as R13.

**LR, the link register**

The link register can be used to hold return link information, and some cases described in this manual require this use of the LR. When software does not require the LR for linking, it can use it for other purposes. Software can refer to LR as R14.

**PC, the program counter**

- When executing an A32 instruction, PC reads as the address of the current instruction plus 8.
- When executing a T32 instruction, PC reads as the address of the current instruction plus 4.
- Writing an address to PC causes a branch to that address.

Most T32 instructions cannot access PC.

The A32 instruction set provides more general access to the PC, and many A32 instructions can use the PC as a general-purpose register. However, ARM deprecates the use of PC for any purpose other than as the program counter. See *Writing to the PC* on page E1-2317 for more information.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

Software can refer to PC as R15.

See *AArch32 general-purpose registers, the PC, and the Special-purpose registers* on page G1-3763 for the system level view of these registers.

**Note**

In general, ARM strongly recommends using the names SP, LR and PC instead of R13, R14 and R15. However, sometimes it is simpler to use the R13-R15 names when referring to a group of registers. For example, it is simpler to refer to *registers R8 to R15*, rather than to *registers R8 to R12, the SP, LR and PC*. These two descriptions of the group of registers have exactly the same meaning.

### Writing to the PC

In the A32 and T32 instruction sets, many data-processing instructions can write to the PC. Writes to the PC are handled as follows:

- In T32 state, the following 16-bit T32 instruction encodings branch to the value written to the PC:
  - Encoding T2 of *ADD, ADDS (register)* on page F6-2589.
  - Encoding T1 of *MOV, MOVS (register)* on page F6-2813.

  The value written to the PC is forced to be halfword-aligned by ignoring its least significant bit, treating that bit as being 0.
- The `B`, `BL`, `CBNZ`, `CBZ`, `CHKA`, `HB`, `HBL`, `HBLP`, `HBP`, `TBB`, and `TBH` instructions remain in the same instruction set state and branch to the value written to the PC.

  The definition of each of these instructions ensures that the value written to the PC is correctly aligned for the current instruction set state.
- The `BLX` (immediate) instruction switches between A32 and T32 states and branches to the value written to the PC. Its definition ensures that the value written to the PC is correctly aligned for the new instruction set state.
- The following instructions write a value to the PC, treating that value as an interworking address to branch to, with low-order bits that determine the new instruction set state:
  - `BLX` (register), `BX`, and `BXJ`.
  - `LDR` instructions with `<Rt>` equal to the PC.
  - `POP` and all forms of `LDM` except `LDM` (exception return), when the register list includes the PC.
  - In A32 state only, `ADC`, `ADD`, `ADR`, `AND`, `ASR` (immediate), `BIC`, `EOR`, `LSL` (immediate), `LSR` (immediate), `MOV`, `MVN`, `ORR`, `ROR` (immediate), `RRX`, `RSB`, `RSC`, `SBC`, and `SUB` instructions with `<Rd>` equal to the PC and without flag-setting specified.

  For details of how an interworking address specifies the new instruction set state and instruction address, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

  **Note**

  The register-shifted register instructions, that are available only in the A32 instruction set and are summarized in *Data-processing register (register shift)* on page F4-2519, are UNPREDICTABLE if they attempt to write to the PC.
- Some instructions are treated as exception return instructions, and write both the PC and the CPSR. For more information, including which instructions are exception return instructions, see *Exception return to an Exception level using AArch32* on page G1-3796.
- Some instructions cause an exception, and the exception handler address is written to the PC as part of the exception entry.

Non-Confidential - Beta

### Pseudocode description of operations on the AArch32 general-purpose registers and the PC

In pseudocode, the uses of the `R[]` function, with an index parameter `n`, are:

- Reading or writing R0-R12, SP, and LR, using n = 0-12, 13, and 14 respectively.
- Reading the PC, using n = 15.

*Pseudocode description of general-purpose register and PC operations* on page G1-3765 describes accesses to these registers.

Descriptions of A32 store instructions that store the PC value use the `PCStoreValue()` pseudocode function to specify the PC value stored by the instruction:

```
// PCStoreValue()
// ==============

bits(32) PCStoreValue()
    // This function returns the PC value. On architecture versions before ARMv7, it
    // is permitted to instead return PC+4, provided it does so consistently. It is
    // used only to describe A32 instructions, so it returns the address of the current
    // instruction plus 8 (normally) or 12 (when the alternative is permitted).
    return PC;
```

Writing an address to the PC causes either a simple branch to that address or an *interworking* branch that also selects the instruction set to execute after the branch. A simple branch is performed by the `BranchWritePC()` function:

```
// BranchWritePC()
// ===============

BranchWritePC(bits(32) address)
    if CurrentInstrSet() == InstrSet_A32 then
        address<1:0> = '00';
    else
        address<0> = '0';
    BranchTo(address, BranchType_UNKNOWN);
```

An interworking branch is performed by the `BXWritePC()` function:

```
// BXWritePC()
// ===========

BXWritePC(bits(32) address)
    if address<0> == '1' then
        SelectInstrSet(InstrSet_T32);
        address<0> = '0';
    else
        SelectInstrSet(InstrSet_A32);
        // For branches to an unaligned PC counter in A32 state, the processor takes the branch
        // and does one of:
        // * Forces the address to be aligned
        // * Leaves the PC unaligned, meaning the target generates a PC Alignment fault.
        if address<1> == '1' && ConstrainUnpredictableBool() then
            address<1> = '0';
    BranchTo(address, BranchType_UNKNOWN);
```

The `LoadWritePC()` and `ALUWritePC()` functions are used for two cases where the behavior was systematically modified between architecture versions:

```
// LoadWritePC()
// =============

LoadWritePC(bits(32) address)
    BXWritePC(address);

// ALUWritePC()
// ============
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

```
ALUWritePC(bits(32) address)
    if CurrentInstrSet() == InstrSet_A32 then
        BXWritePC(address);
    else
        BranchWritePC(address);
```

### E1.2.4 Process state, PSTATE

Process state or PSTATE is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

The following PSTATE information is accessible at EL0:

**The condition flags**

Flag-setting instructions set these. They are:

**N** Negative condition flag. If the result of the instruction is regarded as a two's complement signed integer, the PE sets this to:

- 1 if the result is negative.
- 0 if the result is positive or zero.

**Z** Zero condition flag. Set to:

- 1 if the result of the instruction is zero.
- 0 otherwise.

A result of zero often indicates an equal result from a comparison.

**C** Carry condition flag. Set to:

- 1 if the instruction results in a carry condition, for example an unsigned overflow that is the result of an addition.
- 0 otherwise.

**V** Overflow condition flag. Set to:

- 1 if the instruction results in an overflow condition, for example a signed overflow that is the result of an addition.
- 0 otherwise.

Conditional instructions test the N, Z, C, and V condition flags, combining them with the *condition code* for the instruction, to determine whether the instruction must be executed. In this way, execution of the instruction is conditional on the result of a previous operation. For more information about conditional execution, see *Conditional execution* on page F2-2447.

**The overflow or saturation flag**

**Q** Some instructions can set this. For those instructions that can, the PE:

- Sets it to 1 if the instruction indicates overflow or saturation.
- Leaves it unchanged otherwise.

For more information, see *Pseudocode description of saturation* on page E1-2315.

**The greater than or equal flags**

**GE[3:0]** The instructions described in *Parallel addition and subtraction instructions* on page F1-2418 update these to indicate the results from individual bytes or halfwords of the operation. These flags can control a later `SEL` instruction. For more information, see *SEL* on page F6-2960.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

PSTATE also contains *PE state controls*. There is no direct access to these from application level instructions, but they can be changed by side-effects of application level instructions. They are:

**Instruction set state**

**J, T** The current instruction set state, as shown in Table E1-1. In ARMv8, the J bit is RES0, see the Note in this section.

**Table E1-1 PSTATE.{J, T} encoding**

| J | T | Instruction set state |
|---|---|---|
| 0 | 0 | A32 |
| 0 | 1 | T32 |

**A32** The PE is executing the A32 instruction set, summarized in both:

- Chapter F4 *A32 Base Instruction Set Encoding*.
- Chapter F5 *T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings*.

**T32** The PE is executing the T32 instruction set, summarized in both:

- Chapter F3 *T32 Base Instruction Set Encoding*.
- Chapter F5 *T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings*.

**Note**

**Encoding with J==1 before ARMv8, Jazelle and T32EE states**

In previous versions of the ARM architecture, the encoding {1, 0} selected Jazelle state, and encoding {1, 1} selected T32EE state. ARMv8 does not support either of these states, and these are encodings for unimplemented instruction set states, see *Unimplemented instruction sets* on page G1-3772.

ARMv8 AArch32 state requires a Trivial Jazelle implementation, see *Trivial implementation of the Jazelle extension* on page G1-3772.

**The IT block state**

**IT[7:0]** The If-Then controls for the T32 `IT` instruction, that applies to the *IT block* of instructions that immediately follows the `IT` instruction. See *IT* on page F6-2690 for a description of the `IT` instruction and its associated `IT` block.

PSTATE.IT divides into two subfields:

**IT[7:5]** Holds the *base condition* for the current IT block. The base condition is the top three bits of the condition code specified by the `<firstcond>` field of the IT instruction.

**IT[4:0]** Encodes:

- The size of the IT block. This is the number of instructions that are to be conditionally executed. The size of the block is implied by the position of the least significant 1 in this field, as shown in Table E1-2 on page E1-2321.
- For each instruction in the IT block, the least significant bit of the condition code. This is encoded where Table E1-2 on page E1-2321 shows N<index>.

  **Note**

  Changing the least significant bit of a condition code from 0 to 1 has the effect of inverting the condition code.

Both subfields are all zeros when no IT block is active.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

When an IT instruction is executed, PSTATE.IT is set according to the <firstcond> field of the instruction and the *Then* and *Else* (T and E) parameters in the instruction. See *IT* on page F6-2690.

When permitted, an instruction in an IT block is conditional, see *Conditional instructions* on page F1-2409 and *Conditional execution* on page F2-2447. The condition code used is the current value of IT[7:4]. When an instruction in an IT block completes its execution normally, PSTATE.IT advances to the next line of Table E1-2. A few instructions, for example BKPT, cannot be conditional and therefore are always executed, ignoring the current value of PSTATE.IT.

For details of what happens if an instruction in an IT block takes an exception, see *Overview of exception entry* on page G1-3781.

An instruction that might complete its normal execution by branching is only permitted in an IT block as the last instruction in the block. This means that normal execution of the instruction always results in PSTATE.IT advancing to normal execution.

Table E1-2 shows the effect of the If-Then controls. N<index> represents an instruction in the IT block. For example, N1 is the first instruction in the block, and N2 is the second instruction in the block.

**Table E1-2 Effect of IT block state controls**

| IT bits[a] | | | | | | Notes |
|---|---|---|---|---|---|---|
| [7:5] | [4] | [3] | [2] | [1] | [0] | |
| cond_base | N1 | N2 | N3 | N4 | 1 | Entry point for an IT block with four instructions |
| cond_base | N1 | N2 | N3 | 1 | 0 | Entry point for an IT block with three instructions |
| cond_base | N1 | N2 | 1 | 0 | 0 | Entry point for an IT block with two instructions |
| cond_base | N1 | 1 | 0 | 0 | 0 | Entry point for an IT block with one instruction |
| 000 | 0 | 0 | 0 | 0 | 0 | Normal execution, not in an IT block |

a. Combinations of the IT bits not shown in this table are reserved.

On a branch or an exception return, if PSTATE.IT is set to a value that is not consistent with the instruction stream being branched to or returned to, then instruction execution is UNPREDICTABLE.

PSTATE.IT affects instruction execution only in T32 state. In A32 state, PSTATE.IT must be 0b00000000, otherwise the behavior is UNPREDICTABLE.

**Endianness mapping**

**E** For data accesses, controls the endianness:

**0** Little-endian.

**1** Big-endian.

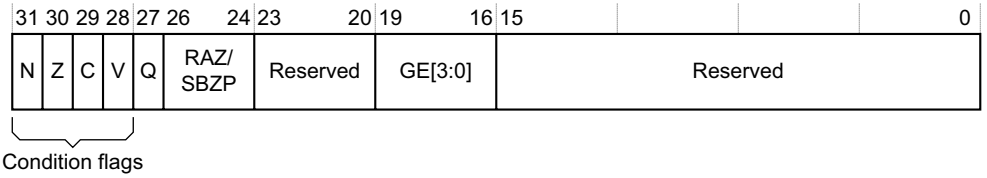
If an implementation does not provide:

- Big-endian support for data accesses, this bit is RES0.
- Little-endian support for data accesses, this bit is RES1.

Instruction fetches are always little-endian, and ignore PSTATE.E.

## Accessing PSTATE fields at EL0

The following sections describe which PSTATE fields can be directly accessed at EL0, and how they can be accessed:



- *The Application Program Status Register, APSR* on page E1-2322.
- *The SETEND instruction* on page E1-2322.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### The Application Program Status Register, APSR

At EL0, some PSTATE fields can be accessed using the Special-purpose *Application Program Status Register* (APSR). The APSR can be directly read using the MRS instruction, and directly written using the MSR (register) and MSR (immediate) instructions.

The APSR bit assignments are:

**N, Z, C, V, bits [31:28]**

The PSTATE condition flags.

**Q, bit [27]** The PSTATE overflow or saturation flag.

**Bits[26:24]** Reserved, RAZ/SBZP. Software can use `MSR` instructions that write the top byte of the APSR without using a read-modify-write sequence. If it does this, it must write zeros to bits[26:24].

**Bits[23:20, 15:0]**

Reserved bits that are allocated to system features, or are available for future expansion. Unprivileged execution ignores writes to fields that are accessible only at EL1 or higher. However, application level software that writes to the APSR must treat reserved bits as *Do-Not-Modify* (DNM) bits. For more information about the reserved bits, see *The Current Program Status Register, CPSR* on page G1-3768.

**GE[3:0], bits [19:16]**

The PSTATE greater than or equal flags.

The other PSTATE fields cannot be accessed by using the APSR.

The system level alias for the APSR is the CPSR. The CPSR is a superset of the APSR. See *The Current Program Status Register, CPSR* on page G1-3768.

Writes to the PSTATE fields have side-effects on various aspects of PE operation. All of these side-effects, except side-effects on memory accesses associated with fetching instructions, are synchronous to the APSR write. This means they are guaranteed:

- Not to be visible to earlier instructions in the execution stream.
- To be visible to later instructions in the execution stream.

### The SETEND instruction

The A32 and T32 instruction sets both include an instruction to manipulate PSTATE.E:

`SETEND BE` Sets PSTATE.E to 1, for big-endian operation.

`SETEND LE` Sets PSTATE.E to 0, for little-endian operation.

The `SETEND` instruction is unconditional. For more information, see *SETEND* on page F6-2962. ARM deprecates use of the `SETEND` instruction.

## Pseudocode description of PSTATE PE state fields

The following pseudocode functions return the current instruction set and select a new instruction set:

```
// CurrentInstrSet()
// =================

InstrSet CurrentInstrSet()

    if UsingAArch32() then
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        result = if PSTATE.T == '0' then InstrSet_A32 else InstrSet_T32;
        // PSTATE.J is RES0. Implementation of T32EE or Jazelle state not permitted.
    else
        result = InstrSet_A64;
    return result;

// SelectInstrSet()
// ================

SelectInstrSet(InstrSet iset)
    assert CurrentInstrSet() IN {InstrSet_A32, InstrSet_T32};
    assert iset IN {InstrSet_A32, InstrSet_T32};

    PSTATE.T = if iset == InstrSet_A32 then '0' else '1';

    return;
```

PSTATE.IT advances after normal execution of an IT block instruction. This is described by the `ITAdvance()` pseudocode function:

```
// AArch32.ITAdvance()
// ===================

AArch32.ITAdvance()
    if PSTATE.IT<2:0> == '000' then
        PSTATE.IT = '00000000';
    else
        PSTATE.IT<4:0> = LSL(PSTATE.IT<4:0>, 1);
    return;
```

The following functions test whether the current instruction is in an IT block, and whether it is the last instruction in an IT block.

```
// InITBlock()
// ===========

boolean InITBlock()
    if CurrentInstrSet() == InstrSet_T32 then
        return PSTATE.IT<3:0> != '0000';
    else
        return FALSE;

// LastInITBlock()
// ===============

boolean LastInITBlock()
    return (PSTATE.IT<3:0> == '1000');
```

The `BigEndian()` pseudocode function tests whether big-endian data memory accesses are currently selected.

```
// BigEndian()
// ===========

boolean BigEndian()
    boolean bigend;
    if UsingAArch32() then
        bigend = (PSTATE.E != '0');
    elsif PSTATE.EL == EL0 then
        bigend = (SCTLR_EL1.E0E != '0');
    else
        bigend = (SCTLR[].EE != '0');
    return bigend;
```

### E1.2.5 Jazelle support

ARMv8 requires AArch32 state to include a trivial implementation of the Jazelle extension, as described in *Trivial implementation of the Jazelle extension* on page G1-3772.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## E1.3 Advanced SIMD and floating-point instructions

In general, ARMv8 requires implementation of Advanced SIMD and floating-point instructions in the T32 and A32 instruction sets, but see *Implications of not including Advanced SIMD and floating-point support* on page E1-2333.

The Advanced SIMD instructions perform packed *Single Instruction Multiple Data* (SIMD) operations, either integer or single-precision floating-point. The floating-point instructions perform single-precision or double-precision scalar floating-point operations.

These instructions permit *floating-point exceptions*, such as overflow or division by zero, to be handled without trapping. When handled in this way, a floating-point exception causes a cumulative status register bit to be set to 1 and a default result to be produced by the operation. ARMv8 also optionally supports the trapping of floating-point exceptions, see *Trapping of floating-point exceptions* on page E1-2329. For more information about floating-point exceptions see *Floating-point exceptions* on page E1-2329.

The floating-point and Advanced SIMD instructions also provide conversion functions in both directions between half-precision floating-point and single-precision floating-point.

Some Advanced SIMD instructions support polynomial arithmetic over {0, 1}, as described in *Polynomial arithmetic over {0, 1}* on page A1-45.

For system level information about the Advanced SIMD and Floating-point implementation see *Advanced SIMD and floating-point support* on page G1-3841.

The following sections give more information about the Advanced SIMD and floating-point instructions:

- *Floating-point standards, and terminology* on page A1-48.
- *The SIMD and floating-point register file*.
- *Data types supported by the Advanced SIMD implementation* on page E1-2328.
- *Advanced SIMD and floating-point System registers* on page E1-2328.
- *Trapping of floating-point exceptions* on page E1-2329.
- *Floating-point data types and arithmetic* on page E1-2329.
- *Floating-point exceptions* on page E1-2329.
- *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-2332.
- *Implications of not including Advanced SIMD and floating-point support* on page E1-2333.
- *Pseudocode description of floating-point operations* on page E1-2333.

### E1.3.1 The SIMD and floating-point register file

The Advanced SIMD and floating-point instructions use the same register file, that comprises 32 registers. This is distinct from the register file that holds the general-purpose registers and the PC.

The Advanced SIMD and floating-point views of the register file are different. The following sections describe these different views. Figure E1-1 on page E1-2326 shows the views of the register file, and the way the word, doubleword, and quadword registers overlap.

#### Advanced SIMD views of the register file

Advanced SIMD can view this register file as:

- Sixteen 128-bit quadword registers, `Q0-Q15`.
- Thirty-two 64-bit doubleword registers, `D0-D31`.

These views can be used simultaneously. For example, a program might hold 64-bit vectors in `D0` and `D1` and a 128-bit vector in `Q1`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Floating-point views of the register file

The Advanced SIMD and floating-point register file consists of thirty-two doubleword registers, that can be viewed as:

- Thirty-two 64-bit doubleword registers, `D0-D31`. This view is also available to Advanced SIMD instructions.
- Thirty-two 32-bit single word registers, `S0-S31`. Only half of the set is accessible in this view.

The two views can be used simultaneously.

### SIMD and Floating-point register file mapping onto registers

Figure E1-1 shows the different views of the SIMD and floating-point register file, and the relationship between them.

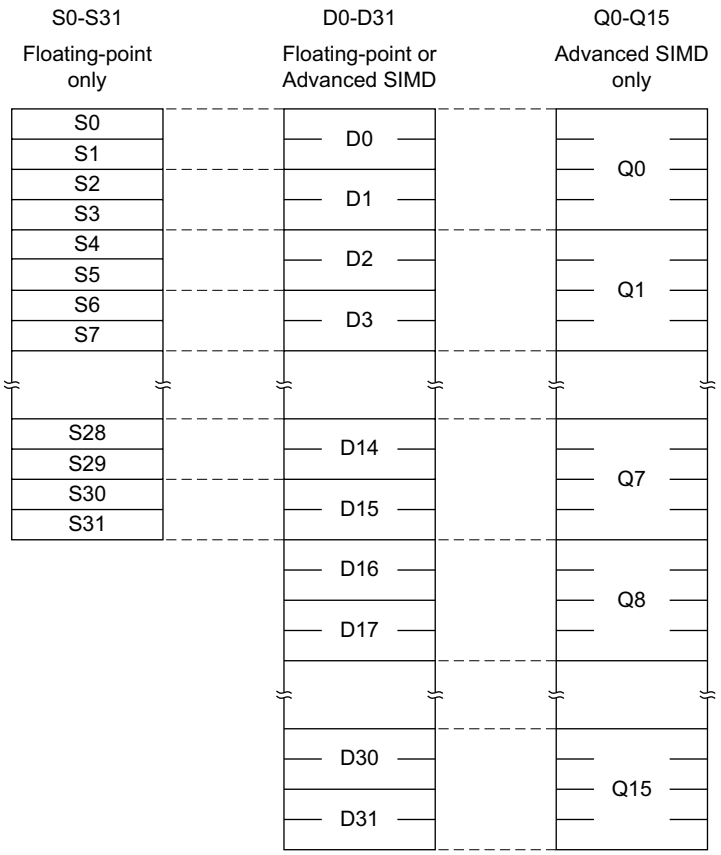

**Figure E1-1 SIMD and floating-point register file, AArch32 operation**

The mapping between the registers is as follows:

- `S<2n>` maps to the least significant half of `D<n>`.
- `S<2n+1>` maps to the most significant half of `D<n>`.
- `D<2n>` maps to the least significant half of `Q<n>`.
- `D<2n+1>` maps to the most significant half of `Q<n>`.

For example, software can access the least significant half of the elements of a vector in `Q6` by referring to `D12`, and the most significant half of the elements by referring to `D13`.

Non-Confidential - Beta

### Pseudocode description of the SIMD and Floating-point register file

The following functions provide the S0-S31, D0-D31, and Q0-Q15 views of the Advanced SIMD and floating-point registers:

```
array bits(64) _Dclone[0..31];

// S[] - non-assignment form
// =========================

bits(32) S[integer n]
    assert n >= 0 && n <= 31;
    base = (n MOD 4) * 32;
    return _V[n DIV 4]<base+31:base>;

// S[] - assignment form
// =====================

S[integer n] = bits(32) value
    assert n >= 0 && n <= 31;
    base = (n MOD 4) * 32;
    _V[n DIV 4]<base+31:base> = value;
    return;

// D[] - non-assignment form
// =========================

bits(64) D[integer n]
    assert n >= 0 && n <= 31;
    base = (n MOD 2) * 64;
    return _V[n DIV 2]<base+63:base>;

// D[] - assignment form
// =====================

D[integer n] = bits(64) value
    assert n >= 0 && n <= 31;
    base = (n MOD 2) * 64;
    _V[n DIV 2]<base+63:base> = value;
    return;
```

The Din[] function returns a Doubleword register from the _Dclone[] copy of the SIMD and Floating-point register file, and the Qin[] function returns a Quadword register from that register file.

**Note**

The CheckAdvancedSIMDEnabled() function copies the D[] register file to _Dclone[], see *Pseudocode description of enabling SIMD and floating-point functionality* on page G1-3879.

```
// Din[] - non-assignment form
// ===========================

bits(64) Din[integer n]
    assert n >= 0 && n <= 31;
    return _Dclone[n];

// Qin[] - non-assignment form
// ===========================

bits(128) Qin[integer n]
    assert n >= 0 && n <= 15;
    return Din[2*n+1]:Din[2*n];
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### E1.3.2 Data types supported by the Advanced SIMD implementation

Advanced SIMD instructions can operate on integer and floating-point data, and the implementation defines a set of data types that support the required data formats. *Vector formats in AArch32 state* on page A1-38 describes these formats.

#### Advanced SIMD vectors

In an implementation that includes support for Advanced SIMD operation, a register can hold one or more packed elements, all of the same size and type. The combination of a register and a data type describes a vector of elements. The vector is considered to be an array of elements of the data type specified in the instruction. The number of elements in the vector is implied by the size of the data elements and the size of the register.

Vector indices are in the range 0 to (number of elements – 1). An index of 0 refers to the least significant end of the vector. In *Vector formats in AArch32 state* on page A1-38, Figure A1-3 on page A1-40 shows the Advanced SIMD vector formats.

##### *Pseudocode description of Advanced SIMD vectors*

The pseudocode function `Elem[]` accesses the element of a specified index and size in a vector:

```
// Elem[] - non-assignment form
// ============================

bits(size) Elem[bits(N) vector, integer e, integer size]
    assert e >= 0 && (e+1)*size <= N;
    return vector<e*size+size-1 : e*size>;

// Elem[] - non-assignment form
// ============================

bits(size) Elem[bits(N) vector, integer e]
    return Elem[vector, e, size];

// Elem[] - assignment form
// ========================

Elem[bits(N) &vector, integer e, integer size] = bits(size) value
    assert e >= 0 && (e+1)*size <= N;
    vector<(e+1)*size-1:e*size> = value;
    return;

// Elem[] - assignment form
// ========================

Elem[bits(N) &vector, integer e] = bits(size) value
    Elem[vector, e, size] = value;
    return;
```

### E1.3.3 Advanced SIMD and floating-point System registers

The Advanced SIMD and floating-point instructions have a shared register space for System registers. Only one register in this space is accessible at the Application level, see *FPSCR, Floating-Point Status and Control Register* on page G6-4317.

Writes to the FPSCR can have side-effects on various aspects of PE operation. All of these side-effects are synchronous to the FPSCR write. This means they are guaranteed not to be visible to earlier instructions in the execution stream, and they are guaranteed to be visible to later instructions in the execution stream.

See *Advanced SIMD and floating-point System registers* on page G1-3843 for the system level view of the registers.

These registers can be described as the *SIMD and floating-point System registers*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### E1.3.4 Trapping of floating-point exceptions

It is IMPLEMENTATION DEFINED whether the floating-point implementation supports the trapping of floating-point exceptions:

- If it does, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable the exception traps.
- Otherwise, the FPSCR trap bits are RES0.

Trapped exception handling never causes the corresponding cumulative exception bit of the FPSCR to be set to 1. If this behavior is desired, the trap handler routine must use a read, modify, write sequence on the FPSCR to set the cumulative exception bit.

### E1.3.5 Floating-point data types and arithmetic

The T32 and A32 floating-point instructions support single-precision (32-bit) and double-precision (64-bit) data types and arithmetic as defined by the IEEE 754 floating-point standard. They also support the half-precision (16-bit) floating-point data type for data storage only, by supporting conversions between single-precision and half-precision data types.

*ARM standard floating-point arithmetic* means IEEE 754 floating-point arithmetic with the restrictions described in *Floating-point and Advanced SIMD support* on page A1-46, including supporting only the input and output values described in *ARM standard floating-point input and output values* on page A1-49.

The AArch32 Advanced SIMD instructions support only single-precision ARM standard floating-point arithmetic.

**Note**

The floating-point instructions require *support code* to be installed in the system if trapped floating-point exception handling is required. See *Floating-point exception traps* on page G1-3844.

The following sections describe the Advanced SIMD and floating-point formats:

- *Half-precision floating-point formats* on page A1-40.
- *Single-precision floating-point format* on page A1-42.
- *Double-precision floating-point format* on page A1-43.

The following sections describe features of Advanced SIMD and floating-point processing:

- *Flush-to-zero* on page A1-49.
- *NaN handling and the Default NaN* on page A1-50.

### E1.3.6 Floating-point exceptions

ARM Advanced SIMD and floating-point instructions record the following floating-point exceptions in the FPSCR cumulative bits, unless the floating-point exception is trapped and generates an exception:

**FPSCR.IOC** Invalid Operation. The bit is set to 1 if the result of an operation has no mathematical value or cannot be represented. Cases include, for example:

- (infinity) × 0.
- (+infinity) + (–infinity).

These tests are made after flush-to-zero processing. For example, if flush-to-zero mode is selected, multiplying a denormalized number and an infinity is treated as (0 × infinity), and causes an Invalid Operation floating-point exception.

IOC is also set on any floating-point operation with one or more signaling NaNs as operands, except for negation and absolute value, as described in *Floating-point negation and absolute value* on page E1-2334.

**FPSCR.DZC** Division by Zero. The bit is set to 1 if a divide operation has a zero divisor and a dividend that is not zero, an infinity or a NaN. These tests are made after flush-to-zero processing, so if flush-to-zero processing is selected, a denormalized dividend is treated as zero and prevents Division by Zero from occurring, and a denormalized divisor is treated as zero and causes Division by Zero to occur if the dividend is a normalized number.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For the reciprocal and reciprocal square root estimate functions the dividend is assumed to be +1.0. This means that a zero or denormalized operand to these functions sets the DZC bit.

**FPSCR.OFC** Overflow. The bit is set to 1 if the absolute value of the result of an operation, produced after rounding, is greater than the maximum positive normalized number for the destination precision.

**FPSCR.UFC** Underflow. The bit is set to 1 if the absolute value of the result of an operation, produced before rounding, is less than the minimum positive normalized number for the destination precision, and the rounded result is inexact.

The criteria for the Underflow exception to occur are different in Flush-to-zero mode. For details, see *Flush-to-zero* on page A1-49.

**FPSCR.IXC** Inexact. The bit is set to 1 if the result of an operation is not equivalent to the value that would be produced if the operation were performed with unbounded precision and exponent range.

The criteria for the Inexact exception to occur are different in Flush-to-zero mode. For details, see *Flush-to-zero* on page A1-49.

**FPSCR.IDC** Input Denormal. The bit is set to 1 if a denormalized input operand is replaced in the computation by a zero, as described in *Flush-to-zero* on page A1-49.

For Advanced SIMD instructions, and for floating-point instructions when floating-point exception trapping is not supported, these are non-trapping exceptions and the data-processing instructions do not generate any trapped exceptions.

For floating-point instructions when floating-point exception trapping is supported:

- These exceptions can be trapped, by setting trap enable bits in the FPSCR, see *Trapping of floating-point exceptions* on page E1-2329 and *Floating-point exception traps* on page G1-3844, and:
  - When a trap is not enabled the corresponding floating-point exception updates the corresponding FPSCR cumulative bit does not generate an exception.
  - When a trap is enabled the corresponding floating-point exception does not update the FPSCR, but generates an exception. In this case, bits in the FPEXC indicate which floating-point exceptions have occurred.
- The definition of the Underflow exception is different in the trapped and cumulative exception cases. In the trapped case the definition is:
  - The trapped Underflow exception occurs if the absolute value of the result of an operation, produced before rounding, is less than the minimum positive normalized number for the destination precision, regardless of whether the rounded result is inexact.
- As with cumulative exceptions, higher priority trapped exceptions can prevent lower priority exceptions from occurring, as described in *Combinations of floating-point exceptions* on page E1-2331.
- For Invalid Operation exceptions, for details of which quiet NaN is produced as the default result see *NaN handling and the Default NaN* on page A1-50.
- For Overflow exceptions, the sign bit of the default result is determined normally for the overflowing operation.
- For Division by Zero exceptions, the sign bit of the default result is determined normally for a division. This means it is the exclusive OR of the sign bits of the two operands.

Table E1-3 on page E1-2331 shows the results of untrapped floating-point exceptions. That table uses the following abbreviations:

**MaxNorm** The maximum normalized number of the destination precision.

**RM** Round towards Minus Infinity mode, as defined in the IEEE 754 standard.

**RN** Round to Nearest mode, as defined in the IEEE 754 standard.

**RP** Round towards Plus Infinity mode, as defined in the IEEE 754 standard.

**RZ** Round towards Zero mode, as defined in the IEEE 754 standard.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For more information about the IEEE 754 descriptions of the rounding modes see *Floating-point standards, and terminology* on page A1-48.

**Table E1-3 Results of untrapped floating-point exceptions**

| Exception type | Default result for positive sign | Default result for negative sign |
|---|---|---|
| IOC, Invalid Operation | Quiet NaN | Quiet NaN |
| DZC, Division by Zero | +infinity | -infinity |
| OFC, Overflow | RN, RP: +infinity<br>RM, RZ: +MaxNorm | RN, RM: -infinity<br>RP, RZ: -MaxNorm |
| UFC, Underflow | Normal rounded result | Normal rounded result |
| IXC, Inexact | Normal rounded result | Normal rounded result |
| IDC, Input Denormal | Normal rounded result | Normal rounded result |

## Combinations of floating-point exceptions

Many pseudocode functions perform *floating-point operations*, including `FixedToFP()`, `FPAdd()`, `FPCompare()`, `FPCompareEQ()`, `FPCompareGE()`, `FPCompareGT()`, `FPDiv()`, `FPMax()`, `FPMin()`, `FPMul()`, `FPMulAdd()`, `FPRecipEstimate()`, `FPRecipStep()`, `FPRSqrtEstimate()`, `FPRSqrtStep()`, `FPSqrt()`, `FPSub()`, and `FPToFixed()`. All of these operations can generate floating-point exceptions.

**Note**

`FPAbs()` and `FPNeg()` are not classified as *floating-point operations* because:

- They cannot generate floating-point exceptions.
- The floating-point operation behavior described in the following sections does not apply to them:
  - *Flush-to-zero* on page A1-49.
  - *NaN handling and the Default NaN* on page A1-50.

More than one exception can occur on the same operation. The only combinations of exceptions that can occur are:

- Overflow with Inexact.
- Underflow with Inexact.
- Input Denormal with other exceptions.

When none of the exceptions caused by an operation is trapped, any exception that occurs causes the associated cumulative bit in the FPSCR to be set.

When one or more exceptions caused by an operation are trapped, the behavior of the instruction depends on the priority of the exceptions. The Inexact exception is treated as lowest priority, and Input Denormal as highest priority:

- If the higher priority exception is trapped, its trap handler is called. It is IMPLEMENTATION DEFINED whether any information about the lower priority exception is provided.

  **Note**

  Information about the lower priority exception might be provided in:

  — The FPEXC, if the exception generated by the trap is taken to an Exception level that is using AArch32.

  — The ESR_ELx.ISS field, if the exception generated by the trap is taken to an Exception level that is using AArch64.

  However, information might be provided in another IMPLEMENTATION DEFINED way, for example using an IMPLEMENTATION DEFINED register.

  Apart from this, the lower priority exception is ignored in this case.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If the higher priority exception is untrapped, its cumulative bit is set to 1 and its default result is evaluated. Then the lower priority exception is handled normally, using this default result.

Some floating-point instructions specify more than one floating-point operation, as indicated by the pseudocode descriptions of the instruction. In such cases, an exception on one operation is treated as higher priority than an exception on another operation if the occurrence of the second exception depends on the result of the first operation. Otherwise, it is UNPREDICTABLE which exception is treated as higher priority.

For example, a `VMLA.F32` instruction specifies a floating-point multiplication followed by a floating-point addition. The addition can generate Overflow, Underflow and Inexact exceptions, all of which depend on both operands to the addition and so are treated as lower priority than any exception on the multiplication. The same applies to Invalid Operation exceptions on the addition caused by adding opposite-signed infinities. The addition can also generate an Input Denormal exception, caused by the addend being a denormalized number while in Flush-to-zero mode. It is UNPREDICTABLE which of an Input Denormal exception on the addition and an exception on the multiplication is treated as higher priority, because the occurrence of the Input Denormal exception does not depend on the result of the multiplication. The same applies to an Invalid Operation exception on the addition caused by the addend being a signaling NaN.

**Note**

- The `VFMA` instruction performs a vector addition and a vector multiplication as a single operation. The `VFMS` instruction performs a vector subtraction and a vector multiplication as a single operation.
- Like other details of Floating-point instruction execution, these rules about exception handling apply to the overall results produced by an instruction when the system uses a combination of hardware and support code to implement it. See *Floating-point exception traps* on page G1-3844 for more information.

### E1.3.7 Controls of Advanced SIMD operation that do not apply to floating-point operation

ARMv7 permitted implementation of either, both, or neither of the Advanced SIMD and floating-point additions to the base instruction set, and provided some controls that applied to the Advanced SIMD functionality but not to the floating-point functionality. In ARMv8, Advanced SIMD functionality cannot be separated from floating-point functionality, but in AArch32 state these controls function as they did in ARMv7. This means they apply only to the following instructions and instruction encodings:

- All instructions with encodings defined in *Advanced SIMD data-processing instructions* on page F5-2553.
- All instructions with encodings defined in *Advanced SIMD element or structure load/store instructions* on page F5-2569.
- The form of the `VDUP` instruction described in *VDUP (general-purpose register)* on page F7-3370.
- The byte and halfword forms of the VMOV instructions described in each of:
  - *VMOV (general-purpose register to scalar)* on page F7-3483.
  - *VMOV (scalar to general-purpose register)* on page F7-3487.

The controls of this functionality are:

- The CPACR.ASEDIS field.
- The HCPTR.TASE field.

In an implementation that supports Advanced SIMD functionality, support for each of these controls is optional:

- If the CPACR.ASEDIS control is not supported then the CPACR.ASEDIS field is RAZ/WI. This is equivalent to the control permitting the execution of Advanced SIMD instructions at EL1 and EL0.
- If the HCPTR.TASE control is not supported then the HCPTR.TASE field is RAZ/WI. This means the HCPTR does not provide a control that can trap Non-secure execution of Advanced SIMD instructions to Hyp mode.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### E1.3.8 Implications of not including Advanced SIMD and floating-point support

In general, ARMv8 requires the inclusion of the Advanced SIMD and floating-point instructions in all instruction sets. Exceptionally, for implementation targeting specialized markets, ARM might produce or license an ARMv8-A implementation that does not provide any support for Advanced SIMD and floating-point instructions. In such an implementation, in AArch32 state:

- Each of the CPACR.{cp10, cp11} fields is RES0.
- The CPACR.ASEDIS bit is RES0.
- Each of the HCPTR.{TASE, TCP10, TCP11} fields is RES1.
- Each of the NSACR.{NSASEDIS, cp10, cp11} fields is RES0.
- The FPEXC register is UNDEFINED.

### E1.3.9 Pseudocode description of floating-point operations

The following subsections contain pseudocode definitions of the floating-point functionality supported by the ARMv8 architecture:

- *Generation of specific floating-point values*.
- *Floating-point negation and absolute value* on page E1-2334.
- *Floating-point value unpacking* on page E1-2335.
- *Floating-point exception and NaN handling* on page E1-2336.
- *Floating-point rounding* on page E1-2338.
- *Selection of ARM standard floating-point arithmetic* on page E1-2339.
- *Floating-point comparisons* on page E1-2340.
- *Floating-point maximum and minimum* on page E1-2341.
- *Floating-point addition and subtraction* on page E1-2342.
- *Floating-point multiplication and division* on page E1-2343.
- *Floating-point fused multiply-add* on page E1-2343.
- *Floating-point reciprocal estimate and step* on page E1-2344.
- *Floating-point square root* on page E1-2347.
- *Floating-point reciprocal square root estimate and step* on page E1-2347.
- *Floating-point conversions* on page E1-2350.

#### Generation of specific floating-point values

The following pseudocode functions generate specific floating-point values. The `sign` argument is `'0'` for the positive version and `'1'` for the negative version.

```
// FPInfinity()
// ============

bits(N) FPInfinity(bit sign)
    assert N IN {16,32,64};
    constant integer E = (if N == 16 then 5 elsif N == 32 then 8 else 11);
    constant integer F = N - E - 1;
    exp  = Ones(E);
    frac = Zeros(F);
    return sign : exp : frac;

// FPMaxNormal()
// =============

bits(N) FPMaxNormal(bit sign)
    assert N IN {16,32,64};
    constant integer E = (if N == 16 then 5 elsif N == 32 then 8 else 11);
    constant integer F = N - E - 1;
    exp  = Ones(E-1):'0';
    frac = Ones(F);
    return sign : exp : frac;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
// FPZero()
// ========

bits(N) FPZero(bit sign)
    assert N IN {16,32,64};
    constant integer E = (if N == 16 then 5 elsif N == 32 then 8 else 11);
    constant integer F = N - E - 1;
    exp  = Zeros(E);
    frac = Zeros(F);
    return sign : exp : frac;

// FPTwo()
// =======

bits(N) FPTwo(bit sign)
    assert N IN {32,64};
    constant integer E = (if N == 32 then 8 else 11);
    constant integer F = N - E - 1;
    exp  = '1':Zeros(E-1);
    frac = Zeros(F);
    return sign : exp : frac;

// FPThree()
// =========

bits(N) FPThree(bit sign)
    assert N IN {32,64};
    constant integer E = (if N == 32 then 8 else 11);
    constant integer F = N - E - 1;
    exp  = '1':Zeros(E-1);
    frac = '1':Zeros(F-1);
    return sign : exp : frac;

// FPDefaultNaN()
// ==============

bits(N) FPDefaultNaN()
    assert N IN {16,32,64};
    constant integer E = (if N == 16 then 5 elsif N == 32 then 8 else 11);
    constant integer F = N - E - 1;
    sign = '0';
    exp  = Ones(E);
    frac = '1':Zeros(F-1);
    return sign : exp : frac;
```

### Floating-point negation and absolute value

The floating-point negation and absolute value operations only affect the sign bit. They do not treat NaN operands specially, nor denormalized number operands when flush-to-zero is selected.

```
// FPNeg()
// =======

bits(N) FPNeg(bits(N) op)
    assert N IN {32,64};
    return NOT(op<N-1>) : op<N-2:0>;

// FPAbs()
// =======

bits(N) FPAbs(bits(N) op)
    assert N IN {32,64};
    return '0' : op<N-2:0>;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Floating-point value unpacking

The FPUnpack() function determines the type and numerical value of a floating-point number. It also does flush-to-zero processing on input operands.

```
enumeration FPType      {FPType_Nonzero, FPType_Zero, FPType_Infinity,
                         FPType_QNaN, FPType_SNaN};

// FPUnpack()
// ==========
//
// Unpack a floating-point number into its type, sign bit and the real number
// that it represents. The real number result has the correct sign for numbers
// and infinities, is very large in magnitude for infinities, and is 0.0 for
// NaNs. (These values are chosen to simplify the description of comparisons
// and conversions.)
//
// The 'fpcr' argument supplies FPCR control bits. Status information is
// updated directly in the FPSR where appropriate.

(FPType, bit, real) FPUnpack(bits(N) fpval, FPCRType fpcr)
    assert N IN {16,32,64};

    if N == 16 then
        sign   = fpval<15>;
        exp16  = fpval<14:10>;
        frac16 = fpval<9:0>;
        if IsZero(exp16) then
            // Produce zero if value is zero
            if IsZero(frac16) then
                type = FPType_Zero;  value = 0.0;
            else
                type = FPType_Nonzero;  value = 2.0^-14 * (Real(UInt(frac16)) * 2.0^-10);
        elsif IsOnes(exp16) && fpcr.AHP == '0' then  // Infinity or NaN in IEEE format
            if IsZero(frac16) then
                type = FPType_Infinity;  value = 2.0^1000000;
            else
                type = if frac16<9> == '1' then FPType_QNaN else FPType_SNaN;
                value = 0.0;
        else
            type = FPType_Nonzero;
            value = 2.0^(UInt(exp16)-15) * (1.0 + Real(UInt(frac16)) * 2.0^-10);

    elsif N == 32 then

        sign   = fpval<31>;
        exp32  = fpval<30:23>;
        frac32 = fpval<22:0>;
        if IsZero(exp32) then
            // Produce zero if value is zero or flush-to-zero is selected.
            if IsZero(frac32) || fpcr.FZ == '1' then
                type = FPType_Zero;  value = 0.0;
                if !IsZero(frac32) then  // Denormalized input flushed to zero
                    FPProcessException(FPExc_InputDenorm, fpcr);
            else
                type = FPType_Nonzero;  value = 2.0^-126 * (Real(UInt(frac32)) * 2.0^-23);
        elsif IsOnes(exp32) then
            if IsZero(frac32) then
                type = FPType_Infinity;  value = 2.0^1000000;
            else
                type = if frac32<22> == '1' then FPType_QNaN else FPType_SNaN;
                value = 0.0;
        else
            type = FPType_Nonzero;
            value = 2.0^(UInt(exp32)-127) * (1.0 + Real(UInt(frac32)) * 2.0^-23);

    else // N == 64
```

```
        sign   = fpval<63>;
        exp64  = fpval<62:52>;
        frac64 = fpval<51:0>;
        if IsZero(exp64) then
            // Produce zero if value is zero or flush-to-zero is selected.
            if IsZero(frac64) || fpcr.FZ == '1' then
                type = FPType_Zero;  value = 0.0;
                if !IsZero(frac64) then  // Denormalized input flushed to zero
                    FPProcessException(FPExc_InputDenorm, fpcr);
            else
                type = FPType_Nonzero;  value = 2.0^-1022 * (Real(UInt(frac64)) * 2.0^-52);
        elsif IsOnes(exp64) then
            if IsZero(frac64) then
                type = FPType_Infinity;  value = 2.0^1000000;
            else
                type = if frac64<51> == '1' then FPType_QNaN else FPType_SNaN;
                value = 0.0;
        else
            type = FPType_Nonzero;
            value = 2.0^(UInt(exp64)-1023) * (1.0 + Real(UInt(frac64)) * 2.0^-52);

    if sign == '1' then value = -value;
    return (type, sign, value);
```

### Floating-point exception and NaN handling

The FPProcessException() procedure checks whether a floating-point exception is trapped, and handles it accordingly:

```
enumeration FPExc       {FPExc_InvalidOp, FPExc_DivideByZero, FPExc_Overflow,
                         FPExc_Underflow, FPExc_Inexact, FPExc_InputDenorm};

// FPProcessException()
// ====================
//
// The 'fpcr' argument supplies FPCR control bits. Status information is
// updated directly in the FPSR where appropriate.

FPProcessException(FPExc exception, FPCRType fpcr)
    // Determine the cumulative exception bit number
    case exception of
        when FPExc_InvalidOp     cumul = 0;
        when FPExc_DivideByZero  cumul = 1;
        when FPExc_Overflow      cumul = 2;
        when FPExc_Underflow     cumul = 3;
        when FPExc_Inexact       cumul = 4;
        when FPExc_InputDenorm   cumul = 7;
    enable = cumul + 8;
    if fpcr<enable> == '1' then
        // Trapping of the exception enabled.
        // It is IMPLEMENTATION DEFINED whether the enable bit may be set at all, and
        // if so then how exceptions may be accumulated before calling FPTrapException()
        IMPLEMENTATION_DEFINED "floating-point trap handling";
    elsif UsingAArch32() then
        // Set the cumulative exception bit
        FPSCR<cumul> = '1';
    else
        // Set the cumulative exception bit
        FPSR<cumul> = '1';
    return;
```

The FPProcessNaN() function processes a NaN operand, producing the correct result value and generating an Invalid Operation exception if necessary:

```
// FPProcessNaN()
// ==============
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
bits(N) FPProcessNaN(FPType type, bits(N) op, FPCRType fpcr)
    assert N IN {32,64};
    assert type IN {FPType_QNaN, FPType_SNaN};

    topfrac = if N == 32 then 22 else 51;
    result = op;
    if type == FPType_SNaN then
        result<topfrac> = '1';
        FPProcessException(FPExc_InvalidOp, fpcr);
    if fpcr.DN == '1' then  // DefaultNaN requested
        result = FPDefaultNaN();
    return result;
```

The `FPProcessNaNs()` function performs the standard NaN processing for a two-operand operation:

```
// FPProcessNaNs()
// ===============
//
// The boolean part of the return value says whether a NaN has been found and
// processed. The bits(N) part is only relevant if it has and supplies the
// result of the operation.
//
// The 'fpcr' argument supplies FPCR control bits. Status information is
// updated directly in the FPSR where appropriate.

(boolean, bits(N)) FPProcessNaNs(FPType type1, FPType type2,
                                 bits(N) op1, bits(N) op2,
                                 FPCRType fpcr)
    assert N IN {32,64};
    if type1 == FPType_SNaN then
        done = TRUE;  result = FPProcessNaN(type1, op1, fpcr);
    elsif type2 == FPType_SNaN then
        done = TRUE;  result = FPProcessNaN(type2, op2, fpcr);
    elsif type1 == FPType_QNaN then
        done = TRUE;  result = FPProcessNaN(type1, op1, fpcr);
    elsif type2 == FPType_QNaN then
        done = TRUE;  result = FPProcessNaN(type2, op2, fpcr);
    else
        done = FALSE;  result = Zeros();  // 'Don't care' result
    return (done, result);
```

The `FPProcessNaNs3()` function performs the standard NaN processing for a three-operand operation:

```
// FPProcessNaNs3()
// ================
//
// The boolean part of the return value says whether a NaN has been found and
// processed. The bits(N) part is only relevant if it has and supplies the
// result of the operation.
//
// The 'fpcr' argument supplies FPCR control bits. Status information is
// updated directly in the FPSR where appropriate.

(boolean, bits(N)) FPProcessNaNs3(FPType type1, FPType type2, FPType type3,
                                  bits(N) op1, bits(N) op2, bits(N) op3,
                                  FPCRType fpcr)
    assert N IN {32,64};
    if type1 == FPType_SNaN then
        done = TRUE;  result = FPProcessNaN(type1, op1, fpcr);
    elsif type2 == FPType_SNaN then
        done = TRUE;  result = FPProcessNaN(type2, op2, fpcr);
    elsif type3 == FPType_SNaN then
        done = TRUE;  result = FPProcessNaN(type3, op3, fpcr);
    elsif type1 == FPType_QNaN then
        done = TRUE;  result = FPProcessNaN(type1, op1, fpcr);
    elsif type2 == FPType_QNaN then
        done = TRUE;  result = FPProcessNaN(type2, op2, fpcr);
    elsif type3 == FPType_QNaN then
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        done = TRUE;  result = FPProcessNaN(type3, op3, fpcr);
    else
        done = FALSE;  result = Zeros();  // 'Don't care' result
    return (done, result);
```

### Floating-point rounding

The FPRound() function rounds and encodes a floating-point result value to a specified destination format. This includes processing Overflow, Underflow and Inexact floating-point exceptions and performing flush-to-zero processing on result values.

```
// FPRound()
// =========

// Convert a real number OP into an N-bit floating-point value using the
// supplied rounding mode RMODE.

bits(N) FPRound(real op, FPCRType fpcr, FPRounding rounding)
    assert N IN {16,32,64};
    assert op != 0.0;
    assert rounding != FPRounding_TIEAWAY;
    bits(N) result;

    // Obtain format parameters - minimum exponent, numbers of exponent and fraction bits.
    if N == 16 then
        minimum_exp = -14;  E = 5;  F = 10;
    elsif N == 32 then
        minimum_exp = -126;  E = 8;  F = 23;
    else  // N == 64
        minimum_exp = -1022;  E = 11;  F = 52;

    // Split value into sign, unrounded mantissa and exponent.
    if op < 0.0 then
        sign = '1';  mantissa = -op;
    else
        sign = '0';  mantissa = op;
    exponent = 0;
    while mantissa < 1.0 do
        mantissa = mantissa * 2.0;  exponent = exponent - 1;
    while mantissa >= 2.0 do
        mantissa = mantissa / 2.0;  exponent = exponent + 1;

    // Deal with flush-to-zero.
    if fpcr.FZ == '1' && N != 16 && exponent < minimum_exp then
        // Flush-to-zero never generates a trapped exception
        if UsingAArch32() then
            FPSCR.UFC = '1';
        else
            FPSR.UFC = '1';
        return FPZero(sign);

    // Start creating the exponent value for the result. Start by biasing the actual exponent
    // so that the minimum exponent becomes 1, lower values 0 (indicating possible underflow).
    biased_exp = Max(exponent - minimum_exp + 1, 0);
    if biased_exp == 0 then mantissa = mantissa / 2.0^(minimum_exp - exponent);

    // Get the unrounded mantissa as an integer, and the "units in last place" rounding error.
    int_mant = RoundDown(mantissa * 2.0^F);  // < 2.0^F if biased_exp == 0, >= 2.0^F if not
    error = mantissa * 2.0^F - Real(int_mant);

    // Underflow occurs if exponent is too small before rounding, and result is inexact or
    // the Underflow exception is trapped.
    if biased_exp == 0 && (error != 0.0 || fpcr.UFE == '1') then
        FPProcessException(FPExc_Underflow, fpcr);

    // Round result according to rounding mode.
    case rounding of
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        when FPRounding_TIEEVEN
            round_up = (error > 0.5 || (error == 0.5 && int_mant<0> == '1'));
            overflow_to_inf = TRUE;
        when FPRounding_POSINF
            round_up = (error != 0.0 && sign == '0');
            overflow_to_inf = (sign == '0');
        when FPRounding_NEGINF
            round_up = (error != 0.0 && sign == '1');
            overflow_to_inf = (sign == '1');
        when FPRounding_ZERO, FPRounding_ODD
            round_up = FALSE;
            overflow_to_inf = FALSE;

    if round_up then
        int_mant = int_mant + 1;
        if int_mant == 2^F then      // Rounded up from denormalized to normalized
            biased_exp = 1;
        if int_mant == 2^(F+1) then  // Rounded up to next exponent
            biased_exp = biased_exp + 1;  int_mant = int_mant DIV 2;

    // Handle rounding to odd aka Von Neumann rounding
    if error != 0.0 && rounding == FPRounding_ODD then
        int_mant<0> = '1';

    // Deal with overflow and generate result.
    if N != 16 || fpcr.AHP == '0' then  // Single, double or IEEE half precision
        if biased_exp >= 2^E - 1 then
            result = if overflow_to_inf then FPInfinity(sign) else FPMaxNormal(sign);
            FPProcessException(FPExc_Overflow, fpcr);
            error = 1.0;  // Ensure that an Inexact exception occurs
        else
            result = sign : biased_exp<N-F-2:0> : int_mant<F-1:0>;
    else                                    // Alternative half precision
        if biased_exp >= 2^E then
            result = sign : Ones(N-1);
            FPProcessException(FPExc_InvalidOp, fpcr);
            error = 0.0;  // Ensure that an Inexact exception does not occur
        else
            result = sign : biased_exp<N-F-2:0> : int_mant<F-1:0>;

    // Deal with Inexact exception.
    if error != 0.0 then
        FPProcessException(FPExc_Inexact, fpcr);

    return result;

// FPRound()
// =========

bits(N) FPRound(real op, FPCRType fpcr)
    return FPRound(op, fpcr, FPRoundingMode(fpcr));
```

## Selection of ARM standard floating-point arithmetic

The `StandardFPSCRValue()` function returns the FPSCR value that selects ARM standard floating-point arithmetic. Most of the arithmetic functions have a Boolean `fpscr_controlled` argument that is `TRUE` for Floating-point operations and `FALSE` for Advanced SIMD operations, and that selects between using the real FPSCR value and this value.

```
// StandardFPSCRValue()
// ====================

FPCRType StandardFPSCRValue()
    return '00000' : FPSCR.AHP : '1100000000000000000000000';
```

### Floating-point comparisons

The FPCompare() function compares two floating-point numbers, producing a {N, Z, C, V} Condition flags result as shown in Table E1-4:

**Table E1-4 Effect of a Floating-point comparison on the Condition flags**

| Comparison result | N | Z | C | V |
|---|---|---|---|---|
| Equal | 0 | 1 | 1 | 0 |
| Less than | 1 | 0 | 0 | 0 |
| Greater than | 0 | 0 | 1 | 0 |
| Unordered | 0 | 0 | 1 | 1 |

This result defines the operation of the VCMP floating-point instruction. The VCMP instruction writes these flag values in the FPSCR. After using a VMRS instruction to transfer them to the APSR, they can control conditional execution as shown in Table F2-1 on page F2-2447.

```
// FPCompare()
// ===========

bits(4) FPCompare(bits(N) op1, bits(N) op2, boolean signal_nans, FPCRType fpcr)
    assert N IN {32,64};
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    if type1==FPType_SNaN || type1==FPType_QNaN || type2==FPType_SNaN || type2==FPType_QNaN then
        result = '0011';
        if type1==FPType_SNaN || type2==FPType_SNaN || signal_nans then
            FPProcessException(FPExc_InvalidOp, fpcr);
    else
        // All non-NaN cases can be evaluated on the values produced by FPUnpack()
        if value1 == value2 then
            result = '0110';
        elsif value1 < value2 then
            result = '1000';
        else  // value1 > value2
            result = '0010';
    return result;
```

The FPCompareEQ(), FPCompareGE() and FPCompareGT() functions describe the operation of Advanced SIMD instructions that perform floating-point comparisons.

```
// FPCompareEQ()
// =============

boolean FPCompareEQ(bits(N) op1, bits(N) op2, FPCRType fpcr)
    assert N IN {32,64};
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    if type1==FPType_SNaN || type1==FPType_QNaN || type2==FPType_SNaN || type2==FPType_QNaN then
        result = FALSE;
        if type1==FPType_SNaN || type2==FPType_SNaN then
            FPProcessException(FPExc_InvalidOp, fpcr);
    else
        // All non-NaN cases can be evaluated on the values produced by FPUnpack()
        result = (value1 == value2);
    return result;

// FPCompareGE()
// =============

boolean FPCompareGE(bits(N) op1, bits(N) op2, FPCRType fpcr)
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

```
    assert N IN {32,64};
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    if type1==FPType_SNaN || type1==FPType_QNaN || type2==FPType_SNaN || type2==FPType_QNaN then
        result = FALSE;
        FPProcessException(FPExc_InvalidOp, fpcr);
    else
        // All non-NaN cases can be evaluated on the values produced by FPUnpack()
        result = (value1 >= value2);
    return result;

// FPCompareGT()
// =============

boolean FPCompareGT(bits(N) op1, bits(N) op2, FPCRType fpcr)
    assert N IN {32,64};
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    if type1==FPType_SNaN || type1==FPType_QNaN || type2==FPType_SNaN || type2==FPType_QNaN then
        result = FALSE;
        FPProcessException(FPExc_InvalidOp, fpcr);
    else
        // All non-NaN cases can be evaluated on the values produced by FPUnpack()
        result = (value1 > value2);
    return result;
```

### Floating-point maximum and minimum

```
// FPMax()
// =======

bits(N) FPMax(bits(N) op1, bits(N) op2, FPCRType fpcr)
    assert N IN {32,64};
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    (done,result) = FPProcessNaNs(type1, type2, op1, op2, fpcr);
    if !done then
        if value1 > value2 then
            (type,sign,value) = (type1,sign1,value1);
        else
            (type,sign,value) = (type2,sign2,value2);
        if type == FPType_Infinity then
            result = FPInfinity(sign);
        elsif type == FPType_Zero then
            sign = sign1 AND sign2; // Use most positive sign
            result = FPZero(sign);
        else
            result = FPRound(value, fpcr);
    return result;

// FPMin()
// =======

bits(N) FPMin(bits(N) op1, bits(N) op2, FPCRType fpcr)
    assert N IN {32,64};
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    (done,result) = FPProcessNaNs(type1, type2, op1, op2, fpcr);
    if !done then
        if value1 < value2 then
            (type,sign,value) = (type1,sign1,value1);

```
bits(32) UnsignedRecipEstimate(bits(32) operand)

    if operand<31> == '0' then  // Operands <= 0x7FFFFFFF produce 0xFFFFFFFF
        result = Ones(32);
    else
        // Generate double-precision value = operand * 2^(-32). This has zero sign bit, with:
        //     exponent = 1022 = double-precision representation of 2^(-1)
        //     fraction taken from operand, excluding its most significant bit.
        dp_operand = '0 01111111110' : operand<30:0> : Zeros(21);

        // Call C function to get reciprocal estimate of scaled value.
        estimate = recip_estimate(dp_operand);

        // Result is double-precision and a multiple of 1/256 in the range 1 to 511/256.
        // Multiply by 2^31 and convert to an unsigned integer - this just involves
        // concatenating the implicit units bit with the top 31 fraction bits.
        result = '1' : estimate<51:21>;

    return result;
```

`recip_estimate()` is defined by the following C function:

```
double recip_estimate(double a)
{
  int q, s;
  double r;
  q = (int)(a * 512.0);         /* a in units of 1/512 rounded down */
  r = 1.0 / (((double)q + 0.5) / 512.0);  /* reciprocal r */
  s = (int)(256.0 * r + 0.5);   /* r in units of 1/256 rounded to nearest */
  return (double)s / 256.0;
}
```

Table E1-5 shows the results where input values are out of range.

**Table E1-5 VRECPE results for out of range inputs**

| Number type | Input Vm[i] | Result Vd[i] |
|---|---|---|
| Integer | <= 0x7FFFFFFF | 0xFFFFFFFF |
| Floating-point | NaN | Default NaN |
| Floating-point | ±0 or denormalized number | ±infinity [a] |
| Floating-point | ±infinity | ±0 |
| Floating-point | Absolute value >= $2^{126}$ | ±0 |

a. FPSCR.DZC is set to 1

The Newton-Raphson iteration:

$x_{n+1} = x_n(2-dx_n)$

converges to $(1/d)$ if $x_0$ is the result of VRECPE applied to $d$.

The VRECPS instruction performs a (2 - op1×op2) calculation and can be used with a multiplication to perform a step of this iteration. The functionality of this instruction is defined by the following pseudocode function:

```
// FPRecipStep()
// =============

bits(32) FPRecipStep(bits(32) op1, bits(32) op2)
    FPCRType fpcr = StandardFPSCRValue();
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
```

            // Convert to scaled single-precision result with copied sign bit and high-order
            // fraction bits, and exponent calculated above.

            if N == 32 then
                result = '0' : result_exp<N-25:0> : estimate<51:29>;
            else // N == 64
                result = '0' : result_exp<N-54:0> : estimate<51:0>;
        return result;

    // UnsignedRSqrtEstimate()
    // =======================

    bits(32) UnsignedRSqrtEstimate(bits(32) operand)

        if operand<31:30> == '00' then  // Operands <= 0x3FFFFFFF produce 0xFFFFFFFF
            result = Ones(32);
        else
            // Generate double-precision value = operand * 2^(-32). This has zero sign bit, with:
            //     exponent = 1022 or 1021 = double-precision representation of 2^(-1) or 2^(-2)
            //     fraction taken from operand, excluding its most significant one or two bits.
            if operand<31> == '1' then
                dp_operand = '0 01111111110' : operand<30:0> : Zeros(21);
            else  // operand<31:30> == '01'
                dp_operand = '0 01111111101' : operand<29:0> : Zeros(22);

            // Call C function to get reciprocal estimate of scaled value.
            estimate = recip_sqrt_estimate(dp_operand);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        // Result is double-precision and a multiple of 1/256 in the range 1 to 511/256.
        // Multiply by 2^31 and convert to an unsigned integer - this just involves
        // concatenating the implicit units bit with the top 31 fraction bits.
        result = '1' : estimate<51:21>;

    return result;
```

`recip_sqrt_estimate()` is defined by the following C function:

```
double recip_sqrt_estimate(double a)
{
  int q0, q1, s;
  double r;
  if (a < 0.5)  /* range 0.25 <= a < 0.5 */
  {
    q0 = (int)(a * 512.0);       /* a in units of 1/512 rounded down */
    r = 1.0 / sqrt(((double)q0 + 0.5) / 512.0); /* reciprocal root r */
  }
  else          /* range 0.5  <= a < 1.0 */
  {
    q1 = (int)(a * 256.0);       /* a in units of 1/256 rounded down */
    r = 1.0 / sqrt(((double)q1 + 0.5) / 256.0); /* reciprocal root r */
  }
  s = (int)(256.0 * r + 0.5);  /* r in units of 1/256 rounded to nearest */
  return (double)s / 256.0;
}
```

Table E1-7 shows the results where input values are out of range.

**Table E1-7 VRSQRTE results for out of range inputs**

| Number type | Input Vm[i] | Result Vd[i] |
|---|---|---|
| Integer | <= 0x3FFFFFFF | 0xFFFFFFFF |
| Floating-point | NaN, –(normalized number), –infinity | Default NaN |
| Floating-point | –0 or –(denormalized number) | – infinity [a] |
| Floating-point | +0 or +(denormalized number) | +infinity [a] |
| Floating-point | +infinity | +0 |

a. FPSCR.DZC is set to 1.

The Newton-Raphson iteration:

$x_{n+1} = x_n(3-dx_n^2)/2$

converges to $(1/\sqrt{d})$ if $x_0$ is the result of VRSQRTE applied to $d$.

The VRSQRTS instruction performs a (3 – op1×op2)/2 calculation and can be used with two multiplications to perform a step of this iteration. The `FPRSqrtStep()` pseudocode function defines the functionality of this instruction:

```
// FPRSqrtStep()
// =============

bits(32) FPRSqrtStep(bits(32) op1, bits(32) op2)
    FPCRType fpcr = StandardFPSCRValue();
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    (done,result) = FPProcessNaNs(type1, type2, op1, op2, fpcr);
    if !done then
        inf1 = (type1 == FPType_Infinity);  inf2 = (type2 == FPType_Infinity);
        zero1 = (type1 == FPType_Zero);     zero2 = (type2 == FPType_Zero);
        bits(32) product;
        if (inf1 && zero2) || (zero1 && inf2) then
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
            product = FPZero('0');
        else
            product = FPMul(op1, op2, fpcr);
        result = FPHalvedSub(FPThree('0'), product, fpcr);
    return result;
```

Table E1-8 shows the results where input values are out of range.

**Table E1-8 VRSQRTS results for out of range inputs**

| Input Vn[i] | Input Vm[i] | Result Vd[i] |
|---|---|---|
| Any NaN | - | Default NaN |
| - | Any NaN | Default NaN |
| ±0.0 or denormalized number | ±infinity | 1.5 |
| ±infinity | ±0.0 or denormalized number | 1.5 |

`FPRSqrtStep()` calls the `FPHalvedSub()` pseudocode function:

```
// FPHalvedSub()
// =============

bits(N) FPHalvedSub(bits(N) op1, bits(N) op2, FPCRType fpcr)
    assert N IN {32,64};
    rounding = FPRoundingMode(fpcr);
    (type1,sign1,value1) = FPUnpack(op1, fpcr);
    (type2,sign2,value2) = FPUnpack(op2, fpcr);
    (done,result) = FPProcessNaNs(type1, type2, op1, op2, fpcr);
    if !done then
        inf1 = (type1 == FPType_Infinity);  inf2 = (type2 == FPType_Infinity);
        zero1 = (type1 == FPType_Zero);     zero2 = (type2 == FPType_Zero);
        if inf1 && inf2 && sign1 == sign2 then
            result = FPDefaultNaN();
            FPProcessException(FPExc_InvalidOp, fpcr);
        elsif (inf1 && sign1 == '0') || (inf2 && sign2 == '1') then
            result = FPInfinity('0');
        elsif (inf1 && sign1 == '1') || (inf2 && sign2 == '0') then
            result = FPInfinity('1');
        elsif zero1 && zero2 && sign1 != sign2 then
            result = FPZero(sign1);
        else
            result_value = (value1 - value2) / 2.0;
            if result_value == 0.0 then  // Sign of exact zero result depends on rounding mode
                result_sign = if rounding == FPRounding_NEGINF then '1' else '0';
                result = FPZero(result_sign);
            else
                result = FPRound(result_value, fpcr);
    return result;
```

## Floating-point conversions

The following function performs conversions between half-precision, single-precision and double-precision floating-point numbers.

```
// FPConvert()
// ===========

// Convert floating point OP with N-bit precision to M-bit precision,
// with rounding controlled by ROUNDING.

bits(M) FPConvert(bits(N) op, FPCRType fpcr, FPRounding rounding)
    assert M IN {16,32,64};
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    assert N IN {16,32,64};
    bits(M) result;

    // Unpack floating-point operand optionally with flush-to-zero.
    (type,sign,value) = FPUnpack(op, fpcr);

    alt_hp = (M == 16) && (fpcr.AHP == '1');

    if type == FPType_SNaN || type == FPType_QNaN then
        if alt_hp then
            result = FPZero(sign);
        elsif fpcr.DN == '1' then
            result = FPDefaultNaN();
        else
            result = FPConvertNaN(op);
        if type == FPType_SNaN || alt_hp then
            FPProcessException(FPExc_InvalidOp,fpcr);
    elsif type == FPType_Infinity then
        if alt_hp then
            result = sign:Ones(M-1);
            FPProcessException(FPExc_InvalidOp, fpcr);
        else
            result = FPInfinity(sign);
    elsif type == FPType_Zero then
        result = FPZero(sign);
    else
        result = FPRound(value, fpcr, rounding);

    return result;

// FPConvert()
// ===========

bits(M) FPConvert(bits(N) op, FPCRType fpcr)
    return FPConvert(op, fpcr, FPRoundingMode(fpcr));
```

The following functions perform conversions between floating-point numbers and integers or fixed-point numbers:

```
// FPToFixed()
// ===========

// Convert N-bit precision floating point OP to M-bit fixed point with
// FBITS fractional bits, controlled by UNSIGNED and ROUNDING.

bits(M) FPToFixed(bits(N) op, integer fbits, boolean unsigned, FPCRType fpcr, FPRounding rounding)
    assert N IN {32,64};
    assert M IN {32,64};
    assert fbits >= 0;
    assert rounding != FPRounding_ODD;

    // Unpack using fpcr to determine if subnormals are flushed-to-zero
    (type,sign,value) = FPUnpack(op, fpcr);

    // If NaN, set cumulative flag or take exception
    if type == FPType_SNaN || type == FPType_QNaN then
        FPProcessException(FPExc_InvalidOp, fpcr);

    // Scale by fractional bits and produce integer rounded towards minus-infinity
    value = value * 2.0^fbits;
    int_result = RoundDown(value);
    error = value - Real(int_result);

    // Determine whether supplied rounding mode requires an increment
    case rounding of
        when FPRounding_TIEEVEN
            round_up = (error > 0.5 || (error == 0.5 && int_result<0> == '1'));
        when FPRounding_POSINF
            round_up = (error != 0.0);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
            when FPRounding_NEGINF
                round_up = FALSE;
            when FPRounding_ZERO
                round_up = (error != 0.0 && int_result < 0);
            when FPRounding_TIEAWAY
                round_up = (error > 0.5 || (error == 0.5 && int_result >= 0));

        if round_up then int_result = int_result + 1;

        // Generate saturated result and exceptions
        (result, overflow) = SatQ(int_result, M, unsigned);
        if overflow then
            FPProcessException(FPExc_InvalidOp, fpcr);
        elsif error != 0.0 then
            FPProcessException(FPExc_Inexact, fpcr);

        return result;

    // FixedToFP()
    // ===========

    // Convert M-bit fixed point OP with FBITS fractional bits to
    // N-bit precision floating point, controlled by UNSIGNED and ROUNDING.

    bits(N) FixedToFP(bits(M) op, integer fbits, boolean unsigned, FPCRType fpcr, FPRounding rounding)
        assert N IN {32,64};
        assert M IN {32,64};
        bits(N) result;
        assert fbits >= 0;
        assert rounding != FPRounding_ODD;

        // Correct signed-ness
        int_operand = Int(op, unsigned);

        // Scale by fractional bits and generate a real value
        real_operand = Real(int_operand) / 2.0^fbits;

        if real_operand == 0.0 then
            result = FPZero('0');
        else
            result = FPRound(real_operand, fpcr, rounding);

        return result;
```

## E1.4 Conceptual coprocessor support

AArch32 state provides a coprocessor interface, that comprises the coprocessor instructions summarized in *Coprocessor instructions* on page F1-2427. These can provide access to sixteen conceptual coprocessors, described as CP0 to CP15. The following coprocessors are reserved by ARM for specific purposes, and from ARMv8 are the only supported coprocessors:

- Coprocessor 15 (CP15) provides system control functionality, by providing access to System registers. This includes architecture and feature identification, as well as control, status information and configuration support.

  The following sections give a general description of CP15:
  - *About the System registers for VMSAv8-32* on page G4-4116.
  - *Organization of the CP15 registers in VMSAv8-32* on page G4-4141.
  - *Functional grouping of VMSAv8-32 System registers* on page G4-4161.

  CP15 also provides performance monitor registers, see Chapter D5 *The Performance Monitors Extension*.

- Coprocessor 14 (CP14) provides access to additional registers, that support:
  - Debug, see Chapter G2 *AArch32 Self-hosted Debug*.
  - The Jazelle identification registers, see *Jazelle support* on page E1-2324.

- Coprocessors 10 and 11 (CP10 and CP11) together support floating-point and Advanced SIMD vector operations, and the control and configuration of Advanced SIMD and floating-point operation.

**Note**

To enable use of the Advanced SIMD and floating-point instructions, software must enable access to both CP10 and CP11, see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

*UNPREDICTABLE and UNDEFINED behavior for AArch32 System register accesses* on page G4-4119 gives information more information about permitted accesses to coprocessors CP14 and CP15.

Most CP14 and CP15 functions cannot be accessed by software executing at EL0. This manual clearly identifies those functions that can be accessed at EL0. However, software executing at EL1 can enable the unprivileged execution of all load, store, branch and data operation instructions associated with floating-point, Advanced SIMD and execution environment support.

## E1.5 Exceptions

The ARM architecture uses the following terms to describe various types of exceptional condition:

**Exceptions** In the ARM architecture, an *exception* causes entry to EL1, EL2, or EL3. If the Exception level that is entered is using AArch32, it also causes entry to the PE mode in which the exception must be taken. A software handler for the exception is then executed.

**Note**

The term *floating-point exception* does not use this meaning of *exception*. This term is described later in this list.

Exceptions include:

- Reset.
- Interrupts.
- Memory system aborts.
- Undefined instructions.
- Supervisor calls (SVCs), Secure Monitor calls (SMCs), and hypervisor calls (HVCs).
- Debug exceptions.

Most details of exception handling are not visible to application level software, and are described in *Handling exceptions that are taken to an Exception level using AArch32* on page G1-3774. In an ARMv8 implementation that includes all the Exception levels, aspects that are visible to application level software are:

- The `SVC` instruction causes a Supervisor Call exception. This provides a mechanism for unprivileged software to make a call to the operating system, or other system component that is accessible only at EL1.
- The `SMC` instruction causes a Secure Monitor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Secure Monitor Call exception by methods defined by the operating system, or by another component of the software system that executes at EL1 or higher.
- The `HVC` instruction causes a Hypervisor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Hypervisor Call exception by methods defined by the hypervisor, or by another component of the software system that executes at EL1 or higher.
- The `BKPT` instruction causes a Software Breakpoint Instruction exception, that is taken as a Prefetch Abort exception. This provides a mechanism for a debugger to insert breakpoints into unprivileged software, or for unprivileged software to make a call into a debugger that is accessible at EL1.
- The `WFI` (Wait for Interrupt) instruction provides a hint that nothing needs to be done until an interrupt or another WFI wake-up event occurs, see *Wait For Interrupt* on page G1-3837. This means the hardware might enter a low-power state until the wake-up event occurs.
- The `WFE` (Wait for Event) instruction provides a hint that nothing needs to be done until either an `SEV` instruction generates an event, or another WFE wake-up event occurs, see *Wait For Event and Send Event* on page G1-3834. This means the hardware might enter a low-power state until the wake-up event occurs.

**Floating-point exceptions**

These relate to exceptional conditions encountered during floating-point arithmetic, such as division by zero or overflow. For more information see:

- *Floating-point exceptions* on page E1-2329.
- *FPEXC, Floating-Point Exception Control register* on page G6-4312.
- *FPSCR, Floating-Point Status and Control Register* on page G6-4317.
- ANSI/IEEE Std. 754, *IEEE Standard for Binary Floating-Point Arithmetic*.

# Chapter E2
# The AArch32 Application Level Memory Model

This chapter gives an application level description of the memory model for software executing in AArch32 state. This means it describes the memory model for execution in EL0 when EL0 is using AArch32 in the following sections:

- *Address space* on page E2-2356.
- *Memory type overview* on page E2-2357.
- *Caches and memory hierarchy* on page E2-2358.
- *Alignment support* on page E2-2363.
- *Endian support* on page E2-2365.
- *Atomicity in the ARM architecture* on page E2-2368.
- *Memory ordering* on page E2-2372.
- *Memory types and attributes* on page E2-2382.
- *Mismatched memory attributes* on page E2-2392.
- *Synchronization and semaphores* on page E2-2395

**Note**

In this chapter, System register names usually link to the description of the register in Chapter G6 *AArch32 System Register Descriptions*, for example SCTLR.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## E2.1 Address space

Address calculations are performed using 32-bit registers. Supervisory software determines the valid address range.

Attempting to access an address that is not valid generates an MMU fault.

Address calculations are performed modulo $2^{32}$.

The result of an address calculation is UNKNOWN if it overflows or underflows the 32-bit address range A[31:0].

Memory accesses use the `MemA[]`, `MemO[]`, `MemU[]`, and `MemU_unpriv[]` pseudocode functions:

- The `MemA[]` function makes an aligned access of the required type.
- The `MemO[]` function makes an ordered access of the required type.
- The `MemU[]` function makes an unaligned access of the required type
- The `MemU_unpriv[]` function makes an unaligned, unprivileged access of the required type.

Each of these functions calls `Mem_with_type[]` function, that specifies the required access. This calls `AArch32.MemSingle[]`, which performs an atomic, little-endian read of `size` bytes.

The `AccType` enumeration defines the different access types.

**Note**

- Chapter G3 *The AArch32 System Level Memory Model* and Chapter G4 *The AArch32 Virtual Memory System Architecture* include descriptions of memory system features that are transparent to the application, including memory access, address translation, memory maintenance instructions, and alignment checking and the associated fault handling. These chapters also reference pseudocode descriptions of these operations.
- For references to the pseudocode that relates to memory accesses, see *Basic memory access* on page G3-3980, *Unaligned memory access* on page G3-3981, and *Aligned memory access* on page G3-3980.

## E2.2 Memory type overview

ARMv8 provides the following mutually-exclusive memory types:

**Normal** This is generally used for bulk memory operations, both read-write and read-only operations.

**Device** The ARM architecture forbids speculative reads of any type of Device memory. This means Device memory types are suitable attributes for read-sensitive locations.

Locations of the memory map that are assigned to peripherals are usually assigned the Device memory attribute.

Device memory has additional attributes that have the following effects:

- They prevent aggregation of reads and writes, maintaining the number and size of the specified memory accesses. See *Gathering* on page E2-2389.
- They preserve the access order and synchronization requirements, both for accesses to a single peripheral and where there is a synchronization requirement on the observability of one or more memory write and read accesses. See *Reordering* on page E2-2390
- They indicate whether a write can be acknowledged other than at the end point. See *Early Write Acknowledgement* on page E2-2390.

- For more information on Normal memory and Device memory, see *Memory types and attributes* on page E2-2382.

**Note**

Earlier versions of the ARM architecture defined a single Device memory type and a Strongly-Ordered memory type. A Note in *Device memory* on page E2-2387 describes how these memory types map onto the ARMv8 memory types.

## E2.3 Caches and memory hierarchy

The implementation of a memory system depends heavily on the microarchitecture and therefore many details of the memory system are IMPLEMENTATION DEFINED. ARMv8 defines the application level interface to the memory system, including a hierarchical memory system with multiple levels of cache. This section describes an application level view of this system. It contains the subsections:

- *Introduction to caches*.
- *Memory hierarchy*.
- *Implication of caches for the application programmer* on page E2-2360.
- *Preloading caches* on page E2-2361.

### E2.3.1 Introduction to caches

A cache is a block of high-speed memory that contains a number of entries, each consisting of:

- Main memory address information, commonly known as a *tag*.
- The associated data.

Caches increase the average speed of a memory access and take account of two principles of locality:

**Spatial locality**

An access to one location is likely to be followed by accesses to adjacent locations. Examples of this principle are:

- Sequential instruction execution.
- Accessing a data structure.

**Temporal locality**

An access to an area of memory is likely to be repeated in a short time period. An example of this principle is the execution of a software loop.

To minimize the quantity of control information stored, the spatial locality property groups several locations together under the same tag. This logical block is commonly known as a *cache line*. When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a *cache hit*, and other accesses are called *cache misses*.

Normally, caches are self-managing, with the updates occurring automatically. Whenever the PE accesses a cacheable memory location, the cache is checked. If the access is a cache hit, the access occurs in the cache. Otherwise, the access is made to memory. Typically, when making this access, a cache location is allocated and the cache line loaded from memory. ARMv8 permits different cache topologies and access policies, provided they comply with the memory coherency model described in this manual.

Caches introduce a number of potential problems, mainly because:

- Memory accesses can occur at times other than when the programmer would expect them.
- A data item can be held in multiple physical locations.

### E2.3.2 Memory hierarchy

Typically memory close to a PE has very low latency, but is limited in size and expensive to implement. Further from the PE it is common to implement larger blocks of memory but these have increased latency. To optimize overall performance, an ARMv8 memory system can include multiple levels of cache in a hierarchical memory system that exploits this trade-off between size and latency. Figure E2-1 on page E2-2359 shows an example of such a system in an ARMv8-A system that supports virtual addressing.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

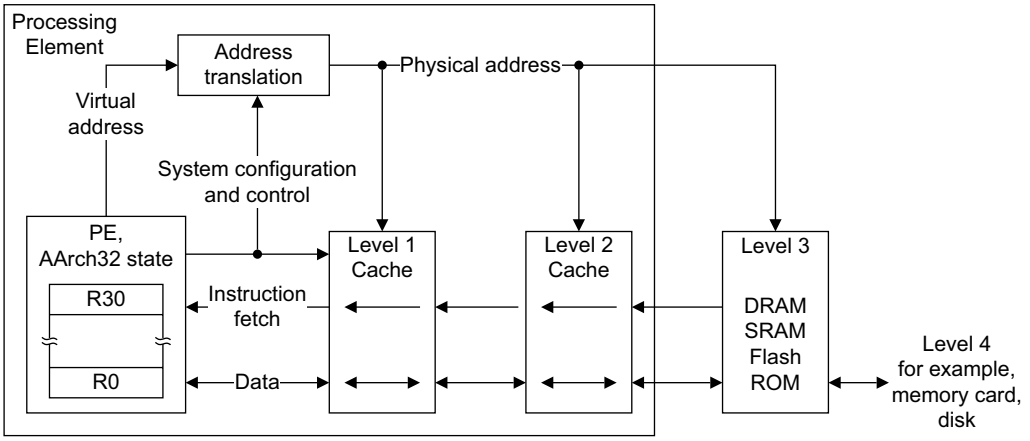

**Figure E2-1 Multiple levels of cache in a memory hierarchy**

**Note**

In this manual, in a hierarchical memory system, Level 1 refers to the level closest to the PE, as shown in Figure E2-1.

Instructions and data can be held in separate caches or in a unified cache. A cache hierarchy can have one or more levels of separate instruction and data caches, with one or more unified caches located at the levels closest to the main memory. Memory coherency for cache topologies can be defined by two conceptual points:

**Point of Unification (PoU)**

The point at which the instruction cache, data cache, and translation table walks of a particular PE are guaranteed to see the same copy of a memory location. In many cases, the point of unification is the point in a uniprocessor memory system by which the instruction and data caches and the translation table walks have merged. The point of unification might coincide with the point of coherency.

**Point of Coherency (PoC)**

The point at which all agents that can access memory are guaranteed to see the same copy of a memory location. In many cases this is effectively the main system memory, although the architecture does not prohibit the implementation of caches beyond the PoC that have no effect on the coherency between memory system agents.

**Note**

The presence of system caches can affect the definition of the point of coherency as described in *System level caches* on page D3-1726.

See also *The ARMv8 cache maintenance functionality* on page G3-3957.

## The Cacheability and Shareability memory attributes

Cacheability and Shareability are two attributes that describe the memory hierarchy in a multiprocessing system:

**Cacheability** This term defines whether memory locations are allowed to be allocated into a cache or not. Cacheability is defined independently for Inner and Outer Cacheability locations.

**Shareability** This term defines whether memory locations are shareable between different agents in a system. Marking a memory location as shareable for a particular domain requires hardware to ensure that the location is coherent for all agents in that domain. Shareability is defined independently for Inner and Outer Shareability domains.

For more information about the Cacheability and Shareability attributes see *Memory types and attributes* on page E2-2382.

Non-Confidential - Beta

### E2.3.3 Implication of caches for the application programmer

In normal operation, the caches are largely invisible to the application programmer. However they can become visible when there is a breakdown in the coherency of the caches. Such a breakdown can occur:

- When memory locations are updated by other agents in the system that do not use hardware management of coherency.
- When memory updates made from the application software must be made visible to other agents in the system, without the use of hardware management of coherency.

For example:

- In the absence of hardware management of coherency of DMA accesses, in a system with a DMA controller that reads memory locations that are held in the data cache of a PE, a breakdown of coherency occurs when the PE has written new data in the data cache, but the DMA controller reads the old data held in memory.
- In a Harvard cache implementation, where there are separate instruction and data caches, a breakdown of coherency occurs when new instruction data has been written into the data cache, but the instruction cache still contains the old instruction data.

#### Data coherency issues

Software can ensure the data coherency of caches in the following ways:

- By not using the caches in situations where coherency issues can arise. This can be achieved by:
  - Using Non-cacheable or, in some cases, Write-Through Cacheable memory.
  - Not enabling caches in the system.
- By using system calls to functions using cache maintenance instructions that execute at a higher Exception level.
- By using hardware coherency mechanisms to ensure the coherency of data accesses to memory for cacheable locations by observers within the different shareability domains, see *Non-shareable Normal memory* on page E2-2384 and *Shareable, Inner Shareable, and Outer Shareable Normal memory* on page E2-2383.

  **Note**

  The performance of these hardware coherency mechanisms is highly implementation-specific. In some implementations the mechanism suppresses the ability to cache shareable locations. In other implementations, cache coherency hardware can hold data in caches while managing coherency between observers within the shareability domains.

#### Synchronization and coherency issues between data and instruction accesses

How far ahead of the current point of execution instructions are fetched from is IMPLEMENTATION DEFINED. Such prefetching can be either a fixed or a dynamically varying number of instructions, and can follow any or all possible future execution paths. For all types of memory:

- The PE might have fetched the instructions from memory at any time since the last *Context synchronization operation* on that PE.
- Any instructions fetched in this way might be executed multiple times, if this is required by the execution of the program, without being re-fetched from memory.

The ARM architecture does not require the hardware to ensure coherency between instruction caches and memory, even for locations of shared memory.

If software requires coherency between instruction execution and memory, it must manage this coherency using the `ISB` and `DSB` memory barriers and cache maintenance instructions. These can only be accessed from an Exception level that is higher than EL0, and therefore require a system call, see *Exception-generating and exception-handling instructions* on page F1-2426. The following code sequence can be used for this purpose:

```
; Coherency example for data and instruction accesses within the same Inner Shareable domain.
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
; Enter this code with <Rt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first line
; instead of STR for a 16-bit instruction.
       STR Rt, [Rn]
       DCCMVAU Rn           ; Clean data cache by MVA to point of unification (PoU)
       DSB                  ; Ensure visibility of the data cleaned from cache
       ICIMVAU Rn           ; Invalidate instruction cache by MVA to PoU
       BPIMVA  Rn           ; Invalidate branch predictor by MVA to PoU
       DSB                  ; Ensure completion of the invalidations
       ISB                  ; Synchronize the fetched instruction stream
```

**Note**

- For accesses that are Non-cacheable or Write-Through, the clean data cache instruction is not required. For accesses that are Non-cacheable, the invalidate instruction cache is not required, because in AArch32 state these accesses are not permitted to be held in an instruction cache.
- This code can be used when the thread of execution modifying the code is the same thread of execution that is executing the code. The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization. See *Concurrent modification and execution of instructions* on page E2-2370.

### E2.3.4 Preloading caches

The ARM architecture provides the memory system hints PLD (Preload Data), PLDW (Preload Data With Intent To Write) and PLI (Preload Instruction) that software can use to communicate the expected use of memory locations to the hardware. The memory system can respond by taking actions that are expected to speed up the memory accesses if they occur. The effect of these memory system hints is IMPLEMENTATION DEFINED. Typically, implementations use this information to bring data or instruction locations into caches.

The Preload instructions are hints, and so implementations can treat them as NOPs without affecting the functional behavior of the device. The instructions cannot generate synchronous Data Abort exceptions, but the resulting memory system operations might, under exceptional circumstances, generate an asynchronous external abort, which is taken using an asynchronous Data Abort exception. For more information, see *Data Abort exception* on page G1-3821.

A PLD, PLDW, or PLI instruction can only cause allocation to software-visible caching structures such caches or TLBs for memory locations that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

A PLD, PLDW, or PLI instruction can access any memory location in Normal memory that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

**Note**

In each case, the entire list applies to each of PLD, PLDW, and PLI.

A PLD, PLDW, or PLI instruction is guaranteed not to access any type of Device memory.

A PLI instruction must not perform any access that cannot be performed by a speculative instruction fetch by the processor. Therefore in a VMSA implementation, if all associated MMUs are disabled, a PLI instruction cannot access any memory location that cannot be accessed by instruction fetches.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The pseudocode enumeration `PrefetchHint` defines the prefetch hint types.

The `Hint_Prefetch()` pseudocode function signals to the memory system that memory accesses of the type `hint` to or from the specified `address` are likely to occur in the near future. The memory system might take some action to speed up the memory accesses when they do occur, such as preloading the specified address into one or more caches as indicated by the innermost cache level `target` and non-temporal hint `stream`.

For more information on `PLD`, `PLI`, and `PLDW`, see:

- *PLD, PLDW (immediate)* on page F6-2866.
- *PLD (literal)* on page F6-2868.
- *PLD, PLDW (register)* on page F6-2870.
- *PLI (immediate, literal)* on page F6-2872.
- *PLI (register)* on page F6-2875.

## E2.4 Alignment support

This section describes alignment support. It contains the following subsections:

- *Instruction alignment*.
- *Unaligned data access*.
- *Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE* on page E2-2364.
- *Unaligned data access restrictions* on page E2-2364.

### E2.4.1 Instruction alignment

A32 instructions are word-aligned.

T32 instructions are halfword-aligned.

### E2.4.2 Unaligned data access

An ARMv8 implementation must support unaligned data accesses to Normal memory by some load and store instructions. As Table E2-1 shows, software can control whether a misaligned access to Normal memory by one of these instructions causes an Alignment fault Data Abort exception:

- By setting SCTLR.A, for unaligned accesses from any mode other than Hyp mode.
- By setting HSCTLR.A, for unaligned accesses from Hyp mode.

**Table E2-1 Alignment requirements of load/store instructions**

| Instructions | Alignment check | Result if check fails when: | |
|---|---|---|---|
| | | SCTLR.A or HSCTLR.A is 0 | SCTLR.A or HSCTLR.A is 1 |
| LDRB, LDREXB, LDRBT, LDRSB, LDRSBT, STRB, STREXB, STRBT, TBB | None | - | - |
| LDRH, LDRHT, LDRSH, LDRSHT, STRH, STRHT, TBH | Halfword | Unaligned access | Alignment fault |
| LDREXH, STREXH, LDAH, STLH, LDAEXH, STLEXH | Halfword | Alignment fault | Alignment fault |
| LDR, LDRT, STR, STRT<br>PUSH, encodings T3 and A2 only<br>POP, encodings T3 and A2 only | Word | Unaligned access | Alignment fault |
| LDREX, STREX, LDA, STL, LDAEX, STLEX | Word | Alignment fault | Alignment fault |
| LDREXD, STREXD, LDAEXD, STLEXD | Doubleword | Alignment fault | Alignment fault |
| All forms of LDM and STM, LDRD, RFE, SRS, STRD | Word | Alignment fault | Alignment fault |
| LDC, LDC2, STC, STC2 | Word | Alignment fault | Alignment fault |
| VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR | Word | Alignment fault | Alignment fault |
| VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4, all with standard alignment | Element size | Unaligned access | Alignment fault |
| VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4, all with :<align> specified[a] | As specified by :<align> | Alignment fault | Alignment fault |

a. Previous versions of this manual used @<align> to specify alignment. Both forms are supported, see Chapter F7 *T32 and A32 Advanced SIMD and floating-point Instruction Descriptions* for more information.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

Any unaligned access to any type of Device memory generates an Alignment fault, see *Alignment faults* on page G4-4085.

### E2.4.3 Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE

Any load instruction that is not faulted by the alignment restrictions shown in Table E2-1 on page E2-2363 and that loads the PC has CONSTRAINED UNPREDICTABLE behavior if the address it loads from is not word-aligned, see *Loads and Stores to unaligned locations* on page K1-5424. This overrules any permitted Load/Store behavior shown in Table E2-1 on page E2-2363.

### E2.4.4 Unaligned data access restrictions

The following points apply to unaligned data accesses in ARMv8:

- Accesses are not guaranteed to be single-copy atomic except at the byte access level, see *Atomicity in the ARM architecture* on page E2-2368.
- Unaligned accesses typically take a number of additional cycles to complete compared to a naturally-aligned access.
- An operation that performs an unaligned access can abort on any memory access that it makes, and can abort on more than one access. This means that an unaligned access that occurs across a page boundary can generate an abort on either side of the boundary.

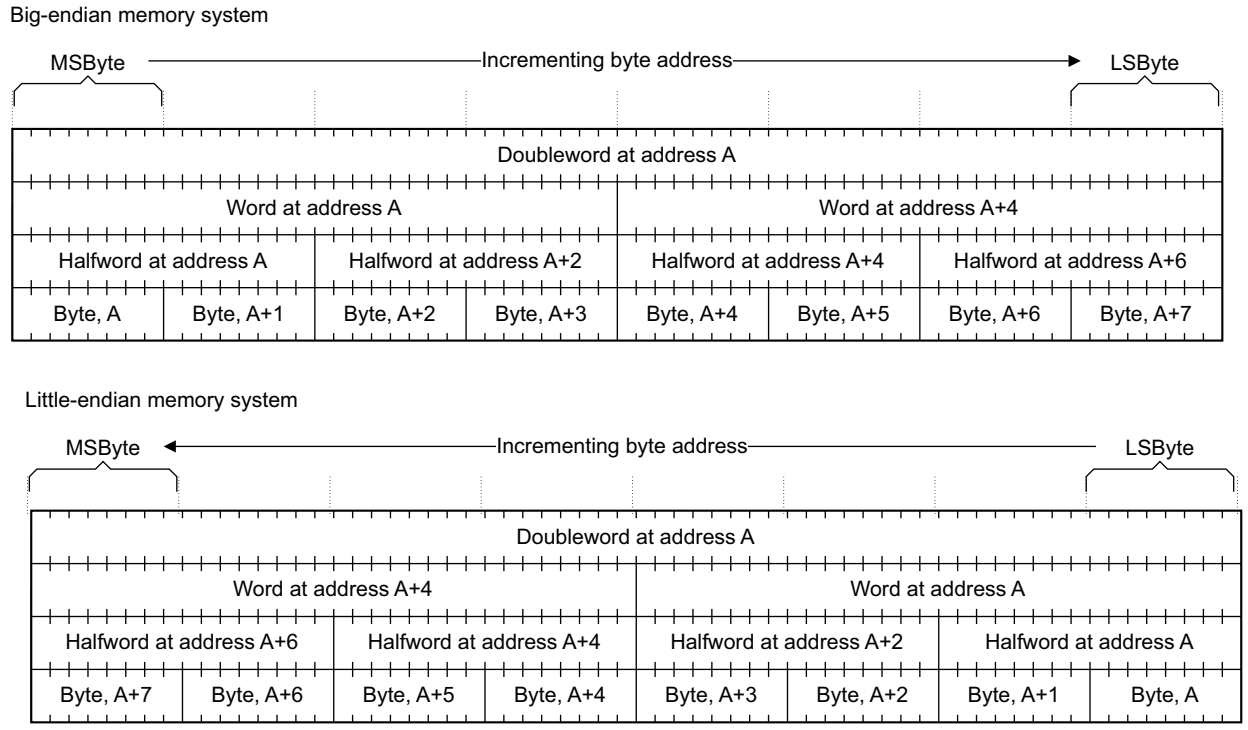
## E2.5 Endian support

*General description of endianness in the ARM architecture* describes the relationship between endianness and memory addressing in the ARM architecture.

The following subsections then describe the endianness schemes supported by the architecture:

- *Instruction endianness*.
- *Data endianness* on page E2-2366.

### E2.5.1 General description of endianness in the ARM architecture



This section only describes memory addressing and the effects of endianness for data elements up to doubleword of 64 bits. However, this description can be extended to apply to larger data elements.

For an address A, Figure E2-2 shows, for big-endian and little-endian memory systems, the relationship between:

- The doubleword at address A.
- The words at addresses A and A+4.
- The halfwords at addresses A, A+2, A+4, and A+6.
- The bytes at addresses A, A+1, A+2, A+3, A+4, A+5, A+6, and A+7.

The terms in Figure E2-2 have the following definitions:

**MSByte** Most-significant byte.
**LSByte** Least-significant byte.

In this figure, *Byte, A+1* is an abbreviation for *Byte at address A+1*

**Figure E2-2 Endianness relationships in AArch32**

### E2.5.2 Instruction endianness

In ARMv8-A, the mapping of instruction memory is always little-endian.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### E2.5.3 Data endianness

The size of the data value that is loaded or stored is the size that is used for the purpose of endian conversion for floating-point, Advanced SIMD, and general-purpose register loads and stores.

Table E2-2 shows the element sizes of all the load/store instructions, for all instruction sets.

**Table E2-2 Element size of load/store instructions**

| Instructions | Element size |
|---|---|
| LDRB, LDREXB, LDRBT, LDRSB, LDRSBT, STRB, STREXB, STRBT, TBB | Byte |
| LDRH, LDREXH, LDRHT, LDRSH, LDRSHT, STRH, STREXH, STRHT, TBH | Halfword |
| LDR, LDRT, LDREX, STR, STRT, STREX | Word |
| LDRD, LDREXD, STRD, STREXD | Word |
| All forms of LDM, PUSH, POP, RFE, SRS, all forms of STM, | Word |
| LDC, LDC2, STC, STC2 | Word |
| Forms of VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR that transfer 32-bit Si registers | Word |
| Forms of VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR that transfer 64-bit Di registers | Doubleword |
| VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4 | Element size of the Advanced SIMD access |

CPSR.E determines the data endianness.

The data size used for endianness conversions:

- Is the size of the data value that is loaded or stored for Advanced SIMD and floating-point register and general-purpose register loads and stores.
- Is the size of the data element that is loaded or stored for Advanced SIMD element and data structure loads and stores. For more information see *Endianness in Advanced SIMD* on page E2-2367.

#### Instructions to reverse bytes in registers

An application or device driver might have to interface to memory-mapped peripheral registers or shared memory structures that are not the same endianness as the internal data structures. Similarly, the endianness of the operating system might not match that of the peripheral registers or shared memory. In these cases, the PE requires an efficient method to transform explicitly the endianness of the data.

Table E2-3 shows the instructions that provide this functionality in the A32 and T32 instruction sets:

**Table E2-3 Byte reversal instructions**

| Function | T32 / A32 Instruction | Notes |
|---|---|---|
| Reverse bytes in whole register | REV | For use with general purpose registers. |
| Reverse bytes in 16-bit halfwords | REV16 | For use with general purpose registers. |
| Reverse bytes in halfword and sign-extend | REVSH | For use with general purpose registers. |
| Reverse elements in doublewords, vector | VREV64 | For use with registers in the SIMD and floating-point register file |
| Reverse elements in words, vector | VREV32 | For use with registers in the SIMD and floating-point register file |
| Reverse elements in halfwords, vector | VREV16 | For use with registers in the SIMD and floating-point register file |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Endianness in Advanced SIMD

Advanced SIMD element Load/Store instructions transfer vectors of elements between memory and the SIMD and floating-point register file. An instruction specifies both the length of the transfer and the size of the data elements being transferred. This information is used by the PE to load and store data correctly in both big-endian and little-endian systems.

Consider, for example, the A32 or T32 instruction:

```
VLD1.16 {D0}, [R1]
```

This loads a 64-bit register with four 16-bit values. The four elements appear in the register in array order, with the lowest indexed element fetched from the lowest address. The order of bytes in the elements depends on the endianness configuration, as shown in Figure E2-3. Therefore, the order of the elements in the registers is the same regardless of the endianness configuration.

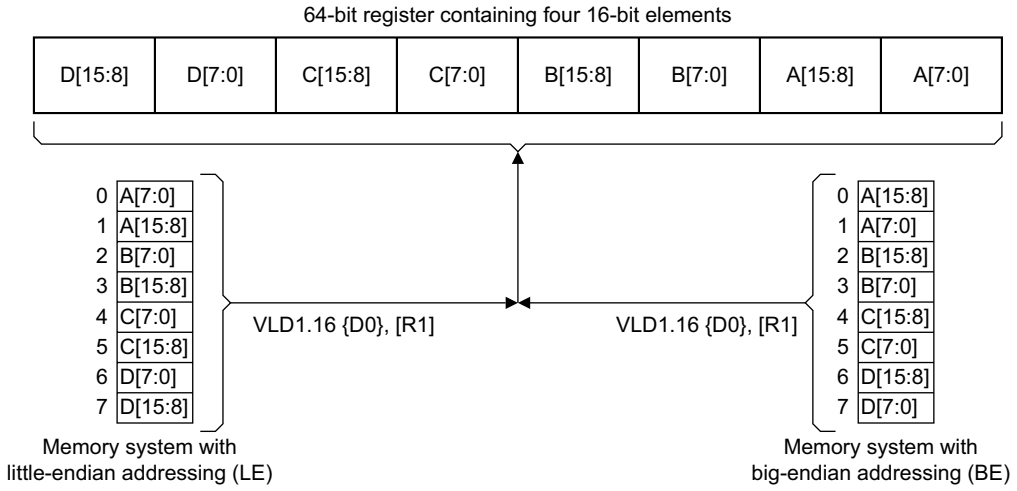


**Figure E2-3 Advanced SIMD byte order example for AArch32**

For information about the alignment of Advanced SIMD instructions see *Alignment support* on page E2-2363.

The `BigEndian()` pseudocode function determines the current endianness of the data.

The `BigEndianReverse()` pseudocode function reverses the endianness of a bitstring.

The `BigEndian()` and `BigEndianReverse()` functions are defined in Chapter J1 *ARMv8 Pseudocode*.

*Non-Confidential - Beta*

## E2.6 Atomicity in the ARM architecture

*Atomicity* is a feature of memory accesses, described as *atomic* accesses. The ARM architecture description refers to two types of atomicity, *single-copy atomicity* and *multicopy atomicity*. In the ARMv8 architecture, the atomicity requirements for memory accesses depend on the memory type, and whether the access is explicit or implicit. For more information see:

- *Requirements for single-copy atomicity*.
- *Properties of single-copy atomic accesses* on page E2-2369.
- *Multi-copy atomicity* on page E2-2369.
- *Requirements for multi-copy atomicity* on page E2-2370.

For more information about the memory types, see *Memory type overview* on page E2-2357.

### E2.6.1 Requirements for single-copy atomicity

In AArch32 state, the single-copy atomic PE accesses are:

- All byte accesses.
- All halfword accesses to halfword-aligned locations.
- All word accesses to word-aligned locations.
- Memory accesses caused by `LDREXD` and `STREXD` instructions to doubleword-aligned locations.

`LDM`, `LDC`, `LDC2`, `LDRD`, `STM`, `STC`, `STC2`, `STRD`, `PUSH`, `POP`, `RFE`, `SRS`, `VLDM`, `VLDR`, `VSTM`, and `VSTR` instructions are executed as a sequence of word-aligned word accesses. Each 32-bit word access is guaranteed to be single-copy atomic. The architecture does not require subsequences of two or more word accesses from the sequence to be single-copy atomic.

`LDRD` and `STRD` accesses to 64-bit aligned locations are 64-bit single-copy atomic as seen by translation table walks and accesses to translation tables.

**Note**

This requirement has been added to avoid the need for complex measures to avoid atomicity issues when changing translation table entries, without creating a requirement that all locations in the memory system are 64-bit single-copy atomic. This addition means:

- The system designer must ensure that all writable memory locations that might be used to hold translations, such as bulk SDRAM, can be accessed with 64-bit single-copy atomicity.
- Software must ensure that translation tables are not held in memory locations that cannot meet this atomicity requirement, such as peripherals that are typically accessed using a narrow bus.

This requirement places no burden on read-only memory locations for which reads have no side effects, since it is impossible to detect the size of memory accesses to such locations.

---

Advanced SIMD element and structure loads and stores are executed as a sequence of accesses of the element or structure size. The architecture requires the element accesses to be single-copy atomic if and only if both:

- The element size is 64 bits, or smaller.
- The elements are naturally aligned.

Accesses to 64-bit elements or structures that are 32-bit aligned are executed as a sequence of 32-bit accesses, each of which is single-copy atomic. The architecture does not require subsequences of two or more 32-bit accesses from the sequence to be single-copy atomic.

When an access is not single-copy atomic by the rules described in this section, it is executed as a sequence of one or more accesses that aggregate to the size of the original access. Each of the accesses in this sequence is single-copy atomic, at least at the byte level.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

In this section, the terms *before the write operation* and *after the write operation* mean before or after the write operation has had its effect on the coherence order of the bytes of the memory location accessed by the write operation.

If, according to these rules, an instruction is executed as a sequence of accesses, a synchronous Data Abort exception or Debug state entry can be taken during that sequence. This causes execution of the instruction to be abandoned. See *Data Abort exception* on page G1-3821.

If the synchronous Data Abort exception is returned from using the preferred return address, the instruction that generated the sequence of accesses is re-executed and so any access that was performed before the exception was taken is repeated. This also applies to an exit from Debug state.

**Note**

The exception behavior for these multiple access instructions means they are not suitable for use for writes to memory for the purpose of software synchronization.

For implicit accesses:

- Cache linefills and evictions have no effect on the single-copy atomicity of explicit transactions or instruction fetches.
- Instruction fetches are single-copy atomic:
  - At 32-bit granularity in A32 state.
  - At 16-bit granularity in T32 state.
- *Concurrent modification and execution of instructions* on page E2-2370 describes additional constraints on the behavior of instruction fetches.
- Translation table walks are performed using accesses that are single-copy atomic:
  - At 32-bit granularity when using Short-descriptor format translation tables.
  - At 64-bit granularity when using Long-descriptor format translation tables.

### E2.6.2 Properties of single-copy atomic accesses

A read or write operation that is *single-copy atomic* has the following properties:

1. For a single-copy atomic store, if the store overlaps another single-copy atomic store, then all of the writes from one of the stores are inserted into the *Coherence order* of each overlapping byte before any of the writes of the other store are inserted into the Coherence orders of the overlapping bytes.
2. If a single-copy atomic load overlaps a single-copy atomic store and for any of the overlapping bytes the load returns the data written by the write inserted into the Coherence order of that byte by the single-copy atomic store then the load must return data from a point in the Coherence order no earlier than the writes inserted into the Coherence order by the single-copy atomic store of all of the overlapping bytes.

### E2.6.3 Multi-copy atomicity

In a multiprocessing system, writes to a memory location are *multi-copy atomic* if the following conditions are both true:

- All writes to the same location are *serialized*, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes.
- A read of a location does not return the value of a write until all observers observe that write.

**Note**

Writes that are not coherent are not multi-copy atomic.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### E2.6.4 Requirements for multi-copy atomicity

For Normal memory, writes are not required to be multi-copy atomic.

For Device memory with the non-Gathering attribute, writes that are single-copy atomic are also multi-copy atomic.

For Device memory with the Gathering attribute, writes are not required to be multi-copy atomic.

### E2.6.5 Concurrent modification and execution of instructions

The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization.

Concurrent modification and execution of instructions can lead to the resulting instruction performing any behavior that can be achieved by executing any sequence of instructions that can be executed from the same Exception level, except where the instruction before modification or the instruction after modification is a:

- `B`, `BL`, `NOP`, `BKPT`, `SVC`, `HVC`, or `SMC` A32 instruction
- `B, BL, BLX, NOP`, `BKPT`, or `SVC` 16-bit T32 instruction.

In addition, for the T32 instructions:

- The most-significant halfword of a32-bit `BL` immediate instruction can be concurrently modified to the most significant halfword of another `BL` immediate instruction:
  - This means that the most significant bits of the immediate value can be modified.
- The most-significant halfword of a 32-bit `BLX` immediate instruction can be concurrently modified to the most significant halfword of another `BLX` immediate instruction:
  - This means that the most significant bits of the immediate value can be modified.
- The most-significant halfword of a 32-bit `BL` immediate or `BLX` immediate instruction can be concurrently modified to a T32 16-bit `B`, `BL`, `BLX`, `BKPT`, or `SVC` instruction. This modification also works in reverse.
- The least-significant halfword of a 32-bit `BL` immediate instruction can be concurrently modified to the least significant halfword of another `BL` instruction with a different immediate:
  - This means that the least significant bits of the immediate value can be modified.
- The least-significant halfword of a 32-bit `BLX` immediate instruction can be concurrently modified to the least significant halfword of another `BLX` immediate instruction with a different immediate:
  - This means that the least significant bits of the immediate value can be modified.
- The least-significant halfword of a 32-bit `B` immediate instruction with a condition field can be concurrently modified to the least significant halfword of another 32-bit `B` immediate instruction with a condition field with a different immediate:
  - This means that the least significant bits of the immediate value can be modified.
- The least-significant halfword of a 32-bit `B` immediate instruction without a condition field can be concurrently modified to the least significant halfword of another 32-bit `B` immediate instruction without a condition field:
  - This means that the least significant bits of the immediate value can be modified.

**Note**

In the T32 instruction set:

- The only encodings of `BKPT` and `SVC` are 16-bit.
- The only encoding of `BL` is 32-bit.

For the instructions explicitly identified in this section, the architecture guarantees that, after modification of the instruction, behavior is consistent with execution of either:

- The instruction originally fetched.
- A fetch of the modified instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The instructions to which this applies are the B, BL, NOP, BKPT, SVC, HVC, and SMC instructions.

For both instruction sets, if one thread of execution changes a conditional branch instruction to another conditional branch instruction, and the change affects both the condition field and the branch target, execution of the changed instruction by another thread of execution before the change is synchronized can lead to either:

- The old condition being associated with the new target address.
- The new condition being associated with the old target address.

These possibilities apply regardless of whether the condition, either before or after the change to the branch instruction, is the *always* condition.

For all other instructions, to avoid UNPREDICTABLE behavior, instruction modifications must be explicitly synchronized before they are executed. The required synchronization is as follows:

1. No PE must be executing an instruction when another PE is modifying that instruction.

2. To ensure that the modified instructions are observable, the PE that modified the instructions must issue the following sequence of instructions and operations:

```
; Coherency example for self-modifying code
; Enter this code with <Rt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first
; line instead of STR for a 16-bit instruction.
STR <Rt>, [Rn]
DCCMVAU Rn                ; Clean data cache by MVA to point of unification (PoU)
DSB                       ; Ensure visibility of the data stored
ICIMVAU Rn                ; Invalidate instruction cache by VA to PoU
BPIMVA  Rn                ; Invalidate branch predictor by MVA to PoU
DSB                       ; Ensure completion of the invalidations
```

   **Note**

   The DCCMVAU operation is not required if the area of memory is either Non-cacheable or Write-through Cacheable.

3. In a multiprocessor system, the ICIMVAU and BPIMVA are broadcast to all PEs within the Inner Shareable domain of the PE running this sequence. However, once the modified instructions are observable, each PE that is executing the modified instructions must issue the following instruction to ensure execution of the modified instructions:

```
ISB                           ; Synchronize fetched instruction stream
```

For more information about the required synchronization operation, see *Synchronization and coherency issues between data and instruction accesses* on page E2-2360.

**Note**

For information about memory accesses caused by instruction fetches, see *Ordering requirements* on page E2-2373.

Non-Confidential - Beta

## E2.7 Memory ordering

This section describes observation ordering. It contains the following subsections:

- *Observability and completion*.
- *Ordering requirements* on page E2-2373.
- *Memory barriers* on page E2-2375.
- *Summary of the memory ordering rules* on page E2-2379.

For information on endpoint ordering of memory accesses, see *Reordering* on page E2-2390.

In the ARMv8 memory model, the shareability memory attribute indicates whether hardware must ensure memory coherency.

The ARMv8 memory system architecture defines additional attributes and associated behaviors, defined in the system level section of this manual. See:

- Chapter G3 *The AArch32 System Level Memory Model*.
- Chapter G4 *The AArch32 Virtual Memory System Architecture*.

See also *Mismatched memory attributes* on page E2-2392.

### E2.7.1 Observability and completion

An *observer* is a master in the system that is capable of observing memory accesses. For a PE, the following mechanisms must be treated as independent observers:

- The mechanism that performs reads or writes to memory.
- A mechanism that causes an instruction cache to be filled from memory or that fetches instructions to be executed directly from memory. These are treated as reads.
- A mechanism that performs translation table walks. These are treated as reads.

The set of observers that can observe a memory access is defined by the system.

In the definitions in this subsection, *subsequent* means whichever of the following is appropriate to the context:

- After the point in time where the location is observed by that observer.
- After the point in time where the location is globally observed.

For all memory:

- A write to a location in memory is said to be *observed* by an observer when:
  - A subsequent read of the location by the same observer returns the value written by the observed write, or written by a write to that location by any observer that is sequenced in the *Coherence order* of the location after the observed write.
  - A subsequent write of the location by the same observer is sequenced in the *Coherence order* of the location after the observed write.
- A write to a location in memory is said to be *globally observed* for a shareability domain or set of observers when:
  - A subsequent read of the location by any observer in that shareability domain returns the value written by the globally observed write, or written by a write to that location by any observer that is sequenced in the *Coherence order* of the location after the globally observed write.
  - A subsequent write of the location by any observer in that shareability domain is sequenced in the *Coherence order* of the location after the globally observed write.
- A read of a location in memory is said to be observed by an observer when a subsequent write to the location by the same observer has no effect on the value returned by the read.
- A read of a location in memory is said to be globally observed for a shareability domain when a subsequent write to the location by any observer in that shareability domain has no effect on the value returned by the read.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Additionally, for Device-nGnRnE memory:

- A read or write of a memory-mapped location in a peripheral that exhibits side-effects is said to be observed, and globally observed, only when the read or write:
  - Meets the general conditions listed.
  - Can begin to affect the state of the memory-mapped peripheral.
  - Can trigger all associated side-effects, whether they affect other peripheral devices, processors, or memory.

  **Note**

  This definition is consistent with the memory access having reached the peripheral.

For all memory, the completion rules are defined as:

- A read or write is complete for a shareability domain when all of the following are true:
  - The read or write is globally observed for that shareability domain.
  - Any translation table walks associated with the read or write are complete for that shareability domain.
- A translation table walk is complete for a shareability domain when the memory accesses associated with the translation table walk are globally observed for that shareability domain, and the TLB is updated.
- A cache or TLB maintenance instruction is complete for a shareability domain when the effects of the instruction are globally observed for that shareability domain, and any translation table walks that arise from the instruction are complete for that shareability domain.

  The completion of any cache or TLB maintenance instruction includes its completion on all processors that are affected by both the instruction and the `DSB` operation that is required to guarantee visibility of the maintenance instruction.

### Completion of side-effects of accesses to Device memory

The completion of a memory access to Device memory is not guaranteed to be sufficient to determine that the side-effects of the memory access are visible to all observers. The mechanism that ensures the visibility of side-effects of a memory access is IMPLEMENTATION DEFINED.

## E2.7.2 Ordering requirements

ARMv8 defines restrictions for the permitted ordering of memory accesses. These restrictions depend on the memory type of the addresses that are accessed, see *Memory types and attributes* on page E2-2382.

**Note**

See *Summary of the memory ordering rules* on page E2-2379 for the definition of *address dependency*.

For accesses to all memory types, the only stores by an observer that can be observed by another observer are those stores that have been *Architecturally executed*. Speculative writes by an observer cannot be observed by another observer. For the purposes of this requirement, speculative writes are all of:

- Writes generated by store instructions that appear in the *Execution stream* after a branch that is not architecturally resolved.
- Writes generated by store instructions that appear in the *Execution stream* after an instruction where a synchronous exception condition has not been architecturally resolved.
- Writes generated by conditional store instructions for which the conditions for the instruction have not been architecturally resolved.
- Writes generated by store instructions for which the data being written comes from a register that has not been architecturally committed.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The following additional restrictions apply to the order in which accesses to memory are observed:

- Reads and writes can be observed in any order provided the following constraints are met:
  - If an address dependency exists between two reads or between a read and a write, then those memory accesses are observed in program order by all observers within the common shareability domain of the memory addresses being accessed.
  - Ordering can be achieved by using a `DMB` or `DSB` barrier. For more information on `DMB` and `DSB` instructions, see *Memory barriers* on page E2-2375.
- Reads and writes to the same address are coherent within the shareability domain of the memory address being accessed.
- Two reads to the same address by the same observer are observed in program order by all observers within the shareability domain of the memory address being accessed.
- Writes are not required to be multi-copy atomic. This means that in the absence of barriers, the observation of a store by one observer does not imply the observation of the store by another observer.
- Instructions that access multiple elements have no defined ordering requirements for the memory accesses relative to each other.

For Device memory with the non-Reordering attribute, the order of memory accesses arriving at a *single peripheral* is the same as occurs in a *Simple sequential execution* on page Glossary-5775 of the program. This means the accesses arrive in program order. This ordering applies for all accesses using any of the memory types with the non-Reordering attribute, which means Device-nGnRE accesses are ordered with respect to Device-nGnRnE accesses to the same peripheral. If the memory accesses are not to a peripheral then there are no ordering restrictions from the non-Reordering attribute. For the purposes of this definition, a *single peripheral* is a region of memory of an IMPLEMENTATION DEFINED size that is defined by the peripheral.

Memory accesses caused by instruction fetches are not required to be observed in program order, unless they are separated by an `ISB` or other context synchronization event.

### Address dependencies and order

In the ARMv8 architecture, a register data dependency between the value returned by a load instruction and the address used by a subsequent memory transaction creates order between that load instruction and the subsequent memory transaction.

A register data dependency exists between a first data value and a second data value when either:

- The register used to hold the first data value is used in the calculation of the second data value, and the calculation between the first data value and the second data value does not consist of either:
  - A conditional branch whose condition is determined by the first data value.
  - A conditional selection, move, or computation whose condition is determined by the first data value, where the input data values for the selection, move, or computation do not have a data dependency on the first data value.
- There is a register data dependency between the first data value and a third data value, and between the third data value and the second data value.

**Note**

A register data dependency can exist even if the value of the first data value is discarded as part of the calculation, as might be the case if it is ANDed with `0x0` or if arithmetic using the first data value cancels out its contribution.

For example, each of the following code sequences creates order between the memory transactions:

**Sequence 1**
```
LDR R1,[R2]
AND R1, R1, #0
LDR R4,[R3, R1]
```

**Sequence 2**
```
LDR R1, [R2]
ADD R3, R3, R1
```

Non-Confidential - Beta

```
SUB R3, R3, R1
STR R4, [R3]
```

### E2.7.3 Memory barriers

The ARM architecture is a weakly ordered memory architecture that supports out of order completion. *Memory barrier* is the general term applied to an instruction, or sequence of instructions, that forces synchronization events by a PE with respect to retiring Load/Store instructions. The memory barriers defined by the ARMv8 architecture provide a range of functionality, including:

- Ordering of Load/Store instructions.
- Completion of Load/Store instructions.
- Context synchronization.

The following subsections describe the ARMv8 memory barrier instructions:

- *Instruction Synchronization Barrier (ISB)*.
- *Data Memory Barrier (DMB)* on page E2-2376.
- *Data Synchronization Barrier (DSB)* on page E2-2377.
- *Shareability and access limitations on the data barrier operations* on page E2-2377.
- *Load-Acquire, Store-Release* on page E2-2378.

**Note**

Depending on the required synchronization, a program might use memory barriers on their own, or it might use them in conjunction with cache maintenance and memory management instructions that in general are only available when software execution is at EL1 or higher.

The DMB and DSB memory barriers affect reads and writes to the memory system generated by Load/Store instructions and data or unified cache maintenance instructions being executed by the PE. Instruction fetches or accesses caused by a hardware translation table access are not explicit accesses.

AArch32 state also supports the legacy barrier instructions CP15DMB, CP15DSB, and CP15ISB. These instructions are executed as MCRs using the appropriate encoding, and are accessible from EL0. However, for performance reasons ARM deprecates any use of these operations, and strongly recommends that software uses the DMB, DSB, and ISB instructions described in this section instead. Optionally, an implementation can support a CP15DEN control that supervisory software can use to disable use of these instructions, meaning the corresponding MCR encodings are UNDEFINED. When the CP15BEN control is supported, setting one of the following CP15BEN fields to 0 makes execution of CP15DMB, CP15DSB, and CP15ISB UNDEFINED:

- SCTLR_EL1.CP15BEN, for execution of these instructions at EL0 using AArch32 when EL1 is using AArch64.
- SCTLR.CP15BEN, for execution of these instructions at EL0 or EL1 when EL1 is using AArch32.
- HSCTLR.CP15BEN, for execution of these instructions at EL2 when EL2 is using AArch32.

#### Instruction Synchronization Barrier (ISB)

An ISB instruction flushes the pipeline in the PE, so that all instructions that come after the ISB instruction in program order are fetched from the cache or memory only after the ISB instruction has completed. Using an ISB ensures that the effects of context-changing operations executed before the ISB are visible to the instructions fetched after the ISB instruction. Examples of context-changing operations that require the insertion of an ISB instruction to ensure the effects of the operation are visible to instructions fetched after the ISB instruction are:

- Completed cache and TLB maintenance instructions.
- Changes to System registers.

Any context-changing operations appearing in program order after the ISB instruction only take effect after the ISB has been executed.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The pseudocode function for the operation of an ISB is InstructionSynchronizationBarrier().

See also *Memory barriers* on page G3-3987.

### Data Memory Barrier (DMB)

The DMB instruction is a data memory barrier. The PE that executes the DMB instruction is referred to as the executing PE, PEe. The DMB instruction takes an <option> argument that specifies the shareability domains and access types to which the instruction applies, see *Shareability and access limitations on the data barrier operations* on page E2-2377.

If the required shareability is *Full system* then the operation applies to all observers within the system.

A DMB creates two groups of memory accesses, Group A and Group B:

**Group A** Contains:

- All explicit memory accesses of the required access types from observers in the same required shareability domain as PEe that are observed by PEe before the DMB instruction. These accesses include any accesses of the required access types performed by PEe.
- All loads of required access types from an observer PEx in the same required shareability domain as PEe that have been observed by any given different observer, PEy, in the same required shareability domain as PEe before PEy has performed a memory access that is a member of Group A.

**Group B** Contains:

- All explicit memory accesses of the required access types by PEe that occur in program order after the DMB instruction.
- All explicit memory accesses of the required access types by any given observer PEx in the same required shareability domain as PEe that can only occur after a load by PEx has returned the result of a store that is a member of Group B.

Any observer with the same required shareability domain as PEe observes all members of Group A before it observes any member of Group B to the extent that those group members are required to be observed, as determined by the shareability and cacheability of the memory addresses accessed by the group members.

If members of Group A and members of Group B access the same memory-mapped peripheral of arbitrary system-defined size, then members of Group A that are accessing Device or Normal Non-cacheable memory arrive at that peripheral before members of Group B that are accessing Device or Normal Non-cacheable memory. Where the members of Group A and Group B that must be ordered are from the same PE, a DMB NSH is sufficient for this guarantee.

**Note**

- A memory access might be in neither Group A nor Group B. The DMB does not affect the order of observation of such a memory access.
- The second part of the definition of Group A is recursive. Ultimately, membership of Group A derives from the observation by PEy of a load before PEy performs an access that is a member of Group A as a result of the first part of the definition of Group A.
- The second part of the definition of Group B is recursive. Ultimately, membership of Group B derives from the observation by any observer of an access by PEe that is a member of Group B as a result of the first part of the definition of Group B.

DMB only affects memory accesses and the operation of data cache and unified cache maintenance instructions, see *The ARMv8 cache maintenance functionality* on page G3-3957. It has no effect on the ordering of any other instructions executing on the PE. A DMB intended to ensure the completion of cache maintenance instructions must have an access type of both loads and stores.

The pseudocode function for the operation of a DMB is DataMemoryBarrier().

See also *Memory barrier instructions* on page G3-3978 and *Memory barriers* on page G3-3987.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Data Synchronization Barrier (DSB)

The DSB instruction is a memory barrier, that synchronizes the execution stream with memory accesses.

The DSB instruction takes an <option> argument that specifies the shareability domains and access types to which the instruction applies, see *Shareability and access limitations on the data barrier operations*.

If the required shareability is *Full system* then the operation applies to all observers within the system.

A DSB behaves as a DMB with the same arguments, and also has the additional properties defined in this section. The PE that executes the DSB instruction is referred to as the executing PE, PEe.

Execution of a DSB at EL2 ensures that any memory accesses caused by speculative translation table walks from the Non-secure PL1&0 translation regime have been observed.

For more information, see *Use of out-of-context translation regimes* on page G4-3998.

A DSB completes when all of the following apply:

- All explicit memory accesses that are observed by PEe before the DSB is executed and are of the required access types, and are from observers in the same required shareability domain as PEe, are complete for the set of observers in the required shareability domain.
- If the required access types of the DSB is reads and writes, then all cache and branch predictor maintenance instructions and all TLB maintenance instructions issued by PEe before the DSB are complete for the required shareability domain.

In addition, no instruction that appears in program order after the DSB instruction can execute until the DSB completes.

See also *Memory barrier instructions* on page G3-3978 and *Memory barriers* on page G3-3987.

### Shareability and access limitations on the data barrier operations

The DMB and DSB instructions can each take an optional limitation argument that specifies:

- The shareability domain over which the instruction must operate. This is one of:
  - Full system.
  - Outer Shareable.
  - Inner Shareable.
  - Non-shareable.
- The accesses for which the instruction operates. This is one of:
  - Read and write accesses in Group A and Group B.
  - Write accesses only in Group A and Group B.
  - Read access only in Group A and read and write accesses in Group B.

**Note**

This form of a DMB or DSB instruction can be described as a Load-Load/Store barrier.

Table E2-4 shows how these options are encoded in the <option> field of the instruction:

**Table E2-4 Encoding of the DMB and DSB <option> parameter**

| Accesses | | Shareability domain | | | |
|---|---|---|---|---|---|
| **Group A** | **Group B** | **Full system** | **Outer Shareable** | **Inner Shareable** | **Non-shareable** |
| Reads and writes | Reads and writes | SY | OSH | ISH | NSH |
| Writes | Writes | ST | OSHST | ISHST | NSHST |
| Reads | Reads and writes | LD | OSHLD | ISHLD | NSHLD |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

If no <option> is specified then the instruction operates for read and write accesses, over the full system, meaning the operation is the same as for the SY option. See the instruction descriptions for more information:

- *DMB* on page F6-2671.
- *DSB* on page F6-2673.

**Note**

ISB also supports an optional limitation argument that can only contain one value that corresponds to full system operation, see *ISB* on page F6-2688.

### Load-Acquire, Store-Release

ARMv8 provides a set of instructions with Acquire semantics for loads, and Release semantics for stores.

For all memory types, these instructions have the following ordering requirements:

- A Store-Release followed by a Load-Acquire is observed in program order by each observer within the shareability domain of the memory address being accessed by the Store-Release and the memory address being accessed by the Load-Acquire.
- For a Load-Acquire, observers in the shareability domain of the address accessed by the Load-Acquire observe accesses in the following order:
  1. The read caused by the Load-Acquire.
  2. Reads and writes caused by loads and stores that appear in program order after the Load-Acquire for which the shareability of the address accessed by the load or store requires that the observer observes the access.

  There are no other ordering requirements on loads or stores that appear before the Load-Acquire.
- For a Store-Release, observers in the shareability domain of the address accessed by the Store-Release observe accesses in the following order:
  1. All of the following for which the shareability of the address accessed requires that the observer observes the access:
     - Reads and writes caused by loads and stores that appear in program order before the Store-Release.
     - Writes that were observed by the PE executing the Store-Release before it executed the Store-Release.
  2. The write caused by the Store-Release.

  There are no additional ordering requirements on loads or stores that appear in program order after the Store-Release.
- All Store-Release instructions must be multi-copy atomic when they are observed with Load-Acquire instructions.

In addition, for accesses to a memory-mapped peripheral of an arbitrary system-defined size that are defined as any type of Device memory accesses, these instructions have the following requirements:

- A Load-Acquire to an address in the memory-mapped peripheral will ensure that all memory accesses using Device memory types to the same memory-mapped peripheral that are architecturally required to be observed after the Load-Acquire will arrive at the memory-mapped peripheral after the memory access of the Load-Acquire.
- A Store-Release to an address in the memory-mapped peripheral will ensure that all memory accesses using Device memory types to the same memory-mapped peripheral that are architecturally required to be observed before the Store-Release will arrive at the memory-mapped peripheral before the memory access of the Store-Release.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If a Load-Acquire to a memory address in the memory-mapped peripheral has observed the value stored to that address by a Store-Release, then any memory access to the memory-mapped peripheral that is architecturally required to be ordered before the memory access of the Store-Release will arrive at the memory-mapped peripheral before any memory access to the same peripheral that is architecturally required to be ordered after the memory access of the Load-Acquire.

Load-Acquire and Store-Release, other than LDAEXD and STLEXD, access only a single data element. This access is single-copy atomic. The address of the data object must be aligned to the size of the data element being accessed, otherwise the access generates an Alignment fault.

LDAEXD and STLEXD access two data elements. The address supplied to the instructions must be doubleword aligned, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the release semantics if the store is successful.

**Note**

- Each Load-Acquire Exclusive and Store-Release Exclusive instruction is essentially a variant of the equivalent Load-Exclusive or Store-Exclusive instruction. All usage restrictions and single-copy atomicity properties:
  - That apply to the Load-Exclusive instructions also apply to the Load-Acquire Exclusive instructions.
  - That apply to the Store-Exclusive instructions also apply to the Store-Release Exclusive instructions.
- The Load-Acquire/Store-Release instructions can remove the requirement to use the explicit DMB memory barrier instruction.

Table E2-5 summarizes the Load-Acquire/Store-release instructions:

**Table E2-5 Load-Acquire/Store-Release instructions**

| Data type | Load-Acquire | Store-Release | Load-Acquire Exclusive | Store-Release Exclusive |
|---|---|---|---|---|
| 32-bit word | LDA | STL | LDAEX | STLEX |
| 16-bit halfword | LDAH | STLH | LDAEXH | STLEXH |
| 8-bit byte | LDAB | STLB | LDAEXB | STLEXB |
| 64-bit doubleword | - | - | LDAEXD | STLEXD |

### E2.7.4 Summary of the memory ordering rules

The following is a concise list of the situations that are required, by the ARM architecture specification, to cause externally-visible order of memory. This ordering means that if memory transaction A has externally visible order ahead of memory transaction B, then all observers within the shareability domains of A and B will observe A before B. See *Terms used in the summary of the memory ordering rules* on page E2-2380 for definitions of the terms used.

**Note**

This list applies to both AArch32 state and AArch64 state, and is consistent with the requirements of ARMv7.

1. DMB and DSB barrier instructions, and load acquire/store release instructions, create externally-visible order as defined by those instructions.
2. A True or False Address dependency from a Load to a Load or from a Load to a Store creates externally-visible order.
3. A True Control dependency from a Load to an ISB instruction creates externally-visible order between the load and any memory accesses after the ISB instruction.
4. A True Register data dependency from a Load to a Store creates externally-visible order.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

5. A True Control dependency from a Load to a Store creates externally-visible order.

6. Memory is coherent within the shareability domain of a memory address, which means there is a total order of all writes to that address that all observers within that shareability domain will agree on.

   **Note**

   A consequence of this is that reads to the same address by the same processor are observed in order.

7. A Dependency from a Store to a Load through memory between different PEs creates externally-visible order but stores are not multi-copy atomic except where explicitly defined to be by the definition of the store.

   **Note**

   A consequence of the lack of multi-copy atomicity is that a Store to Load dependency through memory on the same PE does not create externally-visible order.

No other effects are required to create externally visible order in the ARM architecture.

## Terms used in the summary of the memory ordering rules

The summary uses the following terms:

**Register data dependency**

This is defined in *Address dependencies and order* on page E2-2374.

**False Register data dependency**

A False Register data dependency is a Register data dependency where no register in the system holds a variable for which a change of the first data value causes a change of the second data value.

**True Register data dependency**

A True Register data dependency is a Register data dependency that is not a false Register data dependency.

**True Address dependency**

A True Address dependency between a load and a subsequent memory transaction exists where there is a True Register data dependency between the data value returned from the load and the address used by the subsequent memory transaction.

**False Address dependency**

A False Address dependency between a load and a subsequent memory transaction exists where there is a False Register data dependency between the data value returned from the load and the address used by the subsequent memory transaction.

**True Control dependency**

A True Control dependency between a load and a subsequent instruction exists:

- Where there is a True Register data dependency between the data value returned from the load and data value used in the evaluation of a conditional branch and the subsequent instruction is only executed as a result of one of the possible outcomes of that conditional branch.
- Where there is a True Register data dependency between the data value returned from the load and the data value used in the evaluation of a subsequent instruction that is a conditional selection, move or computation for which both:
  - The condition is determined by the returned data value.
  - No input data value for the selection, move or computation has a register data dependency on the returned data value.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Dependency from a Store to a Load through memory**

A Dependency from a Store to a Load through memory exists where the Store and Load are to the same physical address, and value returned by the Load is the value that was written by the Store, and could not be the value that was previously held in that memory address.

## E2.8 Memory types and attributes

In ARMv8 the ordering of accesses for addresses in memory, referred to as the memory order model, is defined by the memory attributes. The following sections describe this model:

- *Normal memory*.
- *Device memory* on page E2-2387.
- *Memory access restrictions* on page E2-2391.

### E2.8.1 Normal memory

The Normal memory type attribute applies to most memory in a system. It indicates that the hardware is permitted by the architecture to perform speculative data read accesses to these locations, regardless of the access permissions for these locations.

The Normal memory type has the following properties:

- A write to a memory location with the Normal attribute completes in finite time. This means that it is globally observed for the shareability domain of the memory location in finite time. For a Non-cacheable location, the location is observed by all observers in finite time.
- A completed write to a memory location with the Normal attribute is globally observed for the shareability domain of the memory location in finite time without the need for explicit cache maintenance instructions or barriers. For a Non-cacheable location, the completed write is globally observed for all observers in finite time without the need for explicit cache maintenance instructions or barriers.
- Writes to a memory location with the Normal memory attribute that is Non-cacheable must reach the endpoint for that location in the memory system in finite time.
- Unaligned memory accesses can access Normal memory if the system is configured to generate such accesses.
- There is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See *Multi-register loads and stores that access Normal memory* on page E2-2386.

**Note**

- The Normal memory attribute is appropriate for locations of memory that are idempotent, meaning that they exhibit all of the following properties:
  - Read accesses can be repeated with no side-effects.
  - Repeated read accesses return the last value written to the resource being read.
  - Read accesses can fetch additional memory locations with no side-effects.
  - Write accesses can be repeated with no side-effects if the contents of the location accessed are unchanged between the repeated writes or as the result of an exception, as described in this section.
  - Unaligned accesses can be supported.
  - Accesses can be merged before accessing the target memory system.
- An instruction that generates a sequence of accesses as described in *Atomicity in the ARM architecture* on page E2-2368 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated write accesses to a location that has been changed between the write accesses.

The following sections describe the other attributes for Normal memory:

- *Shareable Normal memory* on page E2-2383.
- *Non-shareable Normal memory* on page E2-2384.
- *Write-Through Cacheable, Write-Back Cacheable and Non-cacheable Normal memory* on page E2-2384.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

See also:

- *Multi-register loads and stores that access Normal memory* on page E2-2386.
- *Atomicity in the ARM architecture* on page E2-2368.
- *Memory barriers* on page E2-2375. For accesses to Normal memory, a `DMB` instruction is required to ensure the required ordering.
- *Concurrent modification and execution of instructions* on page E2-2370.

## Shareable Normal memory

A Normal memory location has a Shareability attribute that is defined as one of:

- Inner Shareable.
- Outer Shareable.
- Non-shareable.

The shareability attributes define the data coherency requirements of the location, that hardware must enforce. They do not affect the coherency requirements of instruction fetches, see *Synchronization and coherency issues between data and instruction accesses* on page E2-2360.

**Note**

- System designers can use the Shareability attribute to specify the locations in Normal memory for which coherency must be maintained. However, software developers must not assume that specifying a memory location as Non-shareable permits software to make assumptions about the incoherency of the location between different PEs in a shared memory system. Such assumptions are not portable between different multiprocessing implementations that might use the Shareability attribute. Any multiprocessing implementation might implement caches that are shared, inherently, between different PEs.
- This architecture assumes that all PEs that use the same operating system or hypervisor are in the same Inner Shareable shareability domain.

### *Shareable, Inner Shareable, and Outer Shareable Normal memory*

The ARM architecture abstracts the system as a series of Inner and Outer Shareability domains.

Each Inner Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Inner Shareable attribute made by any member of that set.

Each Outer Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Outer Shareable attribute made by any member of that set.

The following properties also hold:

- Each observer is only a member of a single Inner Shareability domain.
- Each observer is only a member of a single Outer Shareability domain.
- All observers in an Inner Shareability domain are always members of the same Outer Shareability domain. This means that an Inner Shareability domain is a subset of an Outer Shareability domain, although it is not required to be a proper subset.

**Note**

- Because all data accesses to Non-cacheable locations are data coherent to all observers, Non-cacheable locations are always treated as Outer Shareable.
- The Inner Shareable domain is expected to be the set of PEs controlled by a single hypervisor or operating system.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The details of the use of the Shareability attributes are system-specific. Example E2-1 shows how they might be used.

**Example E2-1 Use of shareability attributes**

In an implementation, a particular subsystem with two clusters of PEs has the requirement that:

- In each cluster, the data caches or unified caches of the PEs in the cluster are transparent for all data accesses to memory locations with the Inner Shareable attribute.
- However, between the two clusters, the caches:
  - Are not required to be coherent for data accesses that have only the Inner Shareable attribute.
  - Are coherent for data accesses that have the Outer Shareable attribute.

In this system, each cluster is in a different Shareability domain for the Inner Shareable attribute, but all components of the subsystem are in the same Shareability domain for the Outer Shareable attribute.

A system might implement two such subsystems. If the data caches or unified caches of one subsystem are not transparent to the accesses from the other subsystem, this system has two Outer Shareable Shareability domains.

Having two levels of shareability means system designers can reduce the performance and power overhead for shared memory locations that do not need to be part of the Outer Shareable Shareability domain.

For Shareable Normal memory, the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer in the same Shareability domain.

### Non-shareable Normal memory

For Normal memory locations, the Non-shareable attribute identifies Normal memory that is likely to be accessed only by a single PE.

A location in Normal memory with the Non-shareable attribute does not require the hardware to make data accesses by different observers coherent, unless the memory is Non-cacheable. For a Non-shareable location, if other observers share the memory system, software must use cache maintenance instructions, if the presence of caches might lead to coherency issues when communicating between the observers. This cache maintenance requirement is in addition to the barrier operations that are required to ensure memory ordering.

For Non-shareable Normal memory, it is IMPLEMENTATION DEFINED whether the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer.

### Write-Through Cacheable, Write-Back Cacheable and Non-cacheable Normal memory

In addition to being Outer Shareable, Inner Shareable or Non-shareable, each region of Normal memory is assigned a cacheability attribute that is one of:

- Write-Through Cacheable.
- Write-Back Cacheable.
- Non-cacheable.

Also, for cacheable Normal memory regions:

- A region might be assigned a cache allocation hint.
- It is IMPLEMENTATION DEFINED whether the Write-Through Cacheable and Write-Back Cacheable attributes can have an additional attribute of Transient or Non-transient, see *Transient cacheability attribute* on page E2-2386.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

A memory location can be marked as having different cacheability attributes, for example when using aliases in a virtual to physical address mapping:

- If the attributes differ only in the cache allocation hint this does not affect the behavior of accesses to that location.
- For other cases see *Mismatched memory attributes* on page E2-2392.

The cacheability attributes provide a mechanism of coherency control with observers that lie outside the Shareability domain of a region of memory. In some cases, the use of Write-Through Cacheable or Non-cacheable regions of memory might provide a better mechanism for controlling coherency than the use of hardware coherency mechanisms or the use of cache maintenance routines. To this end, the architecture requires the following properties for Non-cacheable or Write-Through Cacheable memory:

- A completed write to a memory location that is Non-cacheable or Write-Through Cacheable for a level of cache made by an observer accessing the memory system inside the level of cache is visible to all observers accessing the memory system outside the level of cache without the need of explicit cache maintenance.
- A completed write to a memory location that is Non-cacheable for a level of cache made by an observer accessing the memory system outside the level of cache is visible to all observers accessing the memory system inside the level of cache without the need of explicit cache maintenance.

**Note**

Implementations can use the cache allocation hints to indicate a probable performance benefit of caching. For example, a programmer might know that a piece of memory is not going to be accessed again and would be better treated as Non-cacheable. The distinction between memory regions with attributes that differ only in the cache allocation hints exists only as a hint for performance.

For Normal memory, the ARM architecture provides cacheability attributes that are defined independently for each of two conceptual levels of cache, the *inner* and the *outer* cache. The relationship between these conceptual levels of cache and the implemented physical levels of cache is IMPLEMENTATION DEFINED, and can differ from the boundaries between the Inner and Outer Shareability domains. However:

- Inner refers to the innermost caches, meaning the caches that are closest to the PE, and always includes the lowest level of cache.
- No cache that is controlled by the Inner cacheability attributes can lie outside a cache that is controlled by the Outer cacheability attributes.
- An implementation might not have any outer cache.

Example E2-2, Example E2-3 on page E2-2386, and Example E2-4 on page E2-2386 describe the possible ways of implementing a system with three levels of cache, *level 1* (L1) to *level 3* (L3).

**Note**

- L1 cache is the level closest to the PE, see *Memory hierarchy* on page E2-2358.
- When managing coherency, system designs must consider both the inner and outer cacheability attributes, as well as the Shareability attributes. This is because hardware might have to manage the coherency of caches at one conceptual level, even when another conceptual level has the Non-cacheable attribute.

**Example E2-2 Implementation with two inner and one outer cache levels**

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 and L2 cache.
- The Outer cacheability attribute applied to L3 cache.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Example E2-3 Implementation with three inner and no outer cache levels**

Implement the three levels of cache in the system, L1 to L3, with the Inner cacheability attribute applied to L1, L2, and L3 cache. Do not use the Outer cacheability attribute.

**Example E2-4 Implementation with one inner and two outer cache levels**

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 cache.
- The Outer cacheability attribute applied to L2 and L3 cache.

#### *Transient cacheability attribute*

In ARMv8, it is IMPLEMENTATION DEFINED whether a Transient attribute is supported for cacheable Normal memory regions. If an implementation supports this attribute, the set of possible cacheability attributes for a Normal memory region becomes:

- Write-Through Cacheable, Non-transient.
- Write-Back Cacheable, Non-transient.
- Write-Through Cacheable, Transient.
- Write-Back Cacheable, Transient.
- Non-cacheable.

The cacheability attribute can be defined independently for the inner and outer levels of caching.

The transient attribute indicates that the benefit of caching is for a relatively short period. Therefore it might be better to restrict allocation of transient entries, to avoid possibly casting-out other, less transient, entries.

**Note**

The architecture does not specify what is meant by a *relatively short period*.

The description of the MAIR0, MAIR1, HMAIR0, and HMAIR1 registers includes the assignment of the Transient attribute in an implementation that supports this option.

### Multi-register loads and stores that access Normal memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture.

For all instructions that load or store one or more registers from the SIMD and floating-point register file from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions.

### E2.8.2 Device memory

The Device memory type attributes define memory locations where an access to the location can cause side-effects, or where the value returned for a load can vary depending on the number of loads performed. Typically, the Device memory attributes are used for memory-mapped peripherals and similar locations.

The attributes for ARMv8 Device memory are:

**Gathering** Identified as G or nG, see *Gathering* on page E2-2389.

**Reordering** Identified as R or nR, see *Reordering* on page E2-2390.

**Early Write Acknowledgement hint**

Identified as E or nE, see *Early Write Acknowledgement* on page E2-2390.

The ARMv8 Device memory types are:

**Device-nGnRnE** Device non-Gathering, non-Reordering, No Early write acknowledgement.

Equivalent to the Strongly-ordered memory type in earlier versions of the architecture.

**Device-nGnRE** Device non-Gathering, non-Reordering, Early Write Acknowledgement.

Equivalent to the Device memory type in earlier versions of the architecture.

**Device-nGRE** Device non-Gathering, Reordering, Early Write Acknowledgement.

ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. The use of barriers is required to order accesses to Device-nGRE memory.

The Device-nGRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.

**Device-GRE** Device Gathering, Reordering, Early Write Acknowledgement.

ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. Device-GRE memory has the fewest constraints. It behaves similar to Normal memory, with the restriction that speculative accesses to Device-GRE memory is forbidden.

The Device-GRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.

Collectively these are referred to as *any Device memory type*. Going down the list, the memory types are described as getting *weaker*; conversely the going up the list the memory types are described as getting *stronger*.

**Note**

- As the list of types shows, these additional attributes are hierarchical. For example, a memory location that permits Gathering must also permit Reordering and Early Write Acknowledgement.
- The architecture does not require an implementation to distinguish between each of these memory types and ARM recognizes that not all implementations will do so. The subsection that describes each of the attributes, describes the implementation rules for the attribute.
- Earlier versions of the ARM architecture defined the following memory types:
  - Strongly-ordered memory. This is the equivalent of the Device-nGnRnE memory type.
  - Device memory. This is the equivalent of the Device-nGnRE memory type.

All of these memory types have the following properties:

- Speculative data accesses are not permitted to any memory location with any Device memory attribute. This means that each memory access to any Device memory type must be one that would be generated by a simple sequential execution of the program.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

An exception to this applies:

— Reads generated by the Advanced SIMD and floating-point instructions can access bytes that are not explicitly accessed by the instruction if the bytes accessed are in a 16-byte window, aligned to 16-bytes, that contains at least one byte that is explicitly accessed by the instruction.

**Note**

- An instruction that generates a sequence of accesses as described in *Atomicity in the ARM architecture* on page E2-2368 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated accesses to a location where the program only defines a single access. For this reason, ARM strongly recommends that no accesses to Device memory are performed from a single instruction that spans the boundary of a translation granule or which in some other way could lead to some of the accesses being aborted.

  — Write speculation that is visible to other observers is prohibited for all memory types.

- A write to a memory location with any Device memory attribute completes in finite time. This means that it is globally observed for all observers in the system in finite time.
- If a location with any Device memory attribute changes without an explicit write by an observer, this change must also be globally observed for all observers in the system in finite time. Such a change might occur in a peripheral location that holds status information.
- A completed write to a memory location with any Device memory attribute is globally observed for all observers in finite time without the need for explicit maintenance.
- Data accesses to memory locations are coherent for all observers in the system, and correspondingly are treated as being Outer Shareable.
- A memory location with any Device memory attribute cannot be allocated into a cache.
- Writes to a memory location with any Device memory attribute must reach the endpoint for that address in the memory system in finite time. Typically, the endpoint is a peripheral or some physical memory.
- All accesses to memory with any Device memory attribute must be aligned. Any unaligned access generates an Alignment fault at the first stage of translation that defined the location as being Device.

  **Note**

  In the Non-secure PL1&0 translation regime in systems where HCR.TGE==1 and HCR.DC==0, any Alignment fault that results from the fact that all locations are treated as Device is a fault at the first stage of translation. This causes the value of HSR.ISS.[24] to be 0.

- Hardware does not prevent speculative instruction fetches from a memory location with any of the Device memory attributes unless the memory location is also marked as Execute-never for all Exception levels.

  **Note**

  This means that to prevent speculative instruction fetches from memory locations with Device memory attributes, any location that is assigned any Device memory type must also be marked as Execute-never for all Exception levels. Failure to mark a memory location with any Device memory attribute as Execute-never for all Exception levels is a programming error.

See also *Memory access restrictions* on page E2-2391.

The memory types for Translation table walks cannot be defined as any Device memory type within the TCR. For the Non-secure EL1&0 translation regime, the memory accesses made during a stage 1 translation table walk are subject to a stage 2 translation, and as a result of this second stage of translation, the accesses from the first stage translation table walk might be made to memory locations with any Device memory type. These accesses might be made speculatively. When the value of the HCR.PTW bit is 1, a stage 2 permission fault is generated if a first stage translation table walk is made to any Device memory type.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For instruction fetches, if branches cause the program counter to point to an area of memory with the Device attribute which is not marked as Execute-never for the current Exception level, an implementation can either:

- Treat the instruction fetch as if it were to a memory location with the Normal Non-cacheable attribute.
- Take a Permission fault.

### Gathering

In the Device memory attribute:

**G** Indicates that the location has the Gathering attribute.

**nG** Indicates that the location does not have the Gathering attribute, meaning it is non-Gathering.

The Gathering attribute determines whether it is permissible for either:

- Multiple memory accesses of the same type, read or write, to the same memory location to be merged into a single transaction.
- Multiple memory accesses of the same type, read or write, to different memory locations to be merged into a single memory transaction on an interconnect.

For memory types with the Gathering attribute, either of these behaviors is permitted, provided that the ordering and coherency rules of the memory location are followed.

For memory types with the non-Gathering attribute, neither of these behaviors is permitted. As a result:

- The number of memory accesses that are made corresponds to the number that would be generated by a simple sequential execution of the program.
- All access occur at their programmed size, except that there is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See *Multi-register loads and stores that access Device memory* on page E2-2391.

Gathering between memory accesses separated by a memory barrier that affects those memory accesses is not permitted. This applies if one memory access is in Group A and one memory access is in Group B. That is, gathering is not permitted between a memory access in Group A and a memory access in Group B if the two accesses are separated by a barrier that affects at least one of the accesses.

Gathering between two memory accesses generated by a Load-Acquire/Store-Release is not permitted.

A read from a memory location with the non-Gathering attribute cannot come from a cache or a buffer, but must come from the endpoint for that address in the memory system. Typically this is a peripheral or physical memory.

**Note**

- A read from a memory location with the Gathering attribute can come from intermediate buffering of a previous write, provided that:
  - The accesses are not separated by a `DMB` or `DSB` barrier that affects both of the accesses, for example if one access is in Group A and the other is in Group B.
  - The accesses are not separated by other ordering constructions that require that the accesses are in order. Such a construction might be a combination of Load-Acquire and Store-Release.
  - The accesses are not generated by a Store-Release instruction.
- The ARM architecture only defines programmer visible behavior. Therefore, gathering can be performed if a programmer cannot tell whether gathering has occurred.

An implementation is permitted to perform an access with the Gathering attribute in a manner consistent with the requirements specified by the Non-gathering attribute.

An implementation is not permitted to perform an access with the Non-gathering attribute in a manner consistent with the relaxations allowed by the Gathering attribute.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Reordering

In the Device memory attribute:

**R** Indicates that the location has the Reordering attribute.

**nR** Indicates that the location does not have the Reordering attribute, meaning it is non-Reordering.

For all memory types with the non-Reordering attribute, the order of memory accesses arriving at a single peripheral of IMPLEMENTATION DEFINED size, as defined by the peripheral, must be the same order that occurs in a simple sequential execution of the program. That is, the accesses appear in program order. This ordering applies to all accesses using any of the memory types with the non-Reordering attribute. As a result, if there is a mixture of Device-nGnRE and Device-nGnRnE accesses to the same peripheral, these occur in program order. If the memory accesses are not to a peripheral, then this attribute imposes no restrictions.

**Note**

- The IMPLEMENTATION DEFINED size of the single peripheral is the same as applies for the ordering guarantee provided by the `DMB` instruction.
- The ARM architecture only defines programmer visible behavior. Therefore, reordering can be performed if a programmer cannot tell whether reordering has occurred.

An implementation is permitted to perform an access with the Reordering attribute in a manner consistent with the requirements specified by the non-Reordering attribute.

An additional relaxation is that an implementation is not permitted to perform an access with the non-Reordering attribute in a manner consistent with the relaxations allowed by the Reordering attribute.

The non-Reordering attribute does not require any additional ordering, other than that which applies to Normal memory, between:

- Accesses with the non-Reordering attribute and accesses with the Reordering attribute.
- Accesses with the non-Reordering attribute and accesses to Normal memory.
- Accesses with the non-Reordering attribute and accesses to different peripherals of IMPLEMENTATION DEFINED size.

### Early Write Acknowledgement

In the Device memory attribute:

**E** Indicates that the location has the Early Write Acknowledgement attribute.

**nE** Indicates that the location has the No Early Write Acknowledgement attribute.

Early Write Acknowledgement is a hint to the platform memory system. Assigning the No Early Write Acknowledgement attribute to a Device memory location recommends that only the endpoint of the write access returns a write acknowledgement of the access, and that no earlier point in the memory system returns a write acknowledge. This means that a `DSB` barrier, executed by the PE that performed the write to the No Early Write Acknowledgement location, completes only after the write has reached its endpoint in the memory system. Typically, this endpoint is a peripheral or physical memory.

When the Early Write Acknowledgement attribute is assigned to a Device memory location, there is no such recommendation for the handling of accesses to that location.

**Note**

- The Early Write Acknowledgement hint has no effect on the ordering rules. The purpose of signaling no Early Write Acknowledgement is to signal to the interconnect that the peripheral requires the ability to signal the acknowledgement. The No Write Acknowledgement signal also provides an additional semantic that can be interpreted by the driver that is accessing the peripheral.
- This attribute is treated as a hint, as the exact nature of the interconnects attached to a PE is outside the scope of the ARM architecture definition, and not all interconnects provide a mechanism to ensure that a write has reached the physical endpoint of the memory system.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- ARM recommends that writes with the No Early Write Acknowledgement hint are used for PCIe configuration writes. However, the mechanisms by which PCIe configuration writes are identified are IMPLEMENTATION DEFINED.
- ARM strongly recommends that the Early Write Acknowledgement hint is not ignored by a PE, but is made available for use by the system.

---

Because the No Early Write Acknowledgement attribute is a hint:

- An implementation is permitted to perform an access with the Early Write Acknowledgement attribute in a manner consistent with the requirements specified by the No Early Write Acknowledgement attribute.
- An implementation is permitted to perform an access with the No Early Write Acknowledgement attribute in a manner consistent with the relaxations allowed by the Early Write Acknowledgement attribute.

### Multi-register loads and stores that access Device memory

For all instructions that load or store more than one general-purpose register there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load and store instructions.

For all instructions that load or store one or more registers from the SIMD and floating-point register file there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load and store instructions.

For an `LDRD`, `STRD`, or `LDM` instruction with a register list that includes the PC, or an `STM` instruction with a register list that includes the PC, the order in which the registers are accessed is not defined by the architecture.

For a load or store of an Advanced SIMD element or structure, the order in which the registers are accessed is not defined by the architecture.

For a `VLDM`, `VSTM`, `LDM` and `STM` instruction with a register list that does not include the PC, all registers are accessed in ascending address order for Device accesses with the non-Reordering attribute.

## E2.8.3 Memory access restrictions

The following restrictions apply to memory accesses:

- For accesses to any two bytes, *p* and *q*, that are generated by the same instruction:
  - The bytes *p* and *q* must have the same memory type and Shareability attributes. otherwise the results are CONSTRAINED UNPREDICTABLE. For example, an `LDC`, `LDM`, `LDRD` `STC`, `STM` or `STRD` instruction, or an unaligned load or store that spans the boundary between Normal memory and Device memory is CONSTRAINED UNPREDICTABLE.
  - Except for possible differences in the cache allocation hints, ARM deprecates having different cacheability attributes for bytes *p* and *q*.

  For the permitted CONSTRAINED UNPREDICTABLE behavior, see *Crossing a page boundary with different memory types or Shareability attributes* on page K1-5431.
- If the accesses of an instruction that causes multiple accesses to any type of Device memory cross a 4KB address boundary then behavior is CONSTRAINED UNPREDICTABLE and *Crossing a 4KB boundary with a Device access* on page K1-5432 describes the permitted behaviors.

  **Note**
  - The boundary referred to is between two Device memory regions that are both of 4KB and aligned to 4KB.
  - This restriction means it is important that an access to a volatile memory device is not made using a single instruction that crosses a 4KB address boundary.
  - ARM expects this restriction to constrain the placing of volatile memory devices in the system memory map, rather than expecting a compiler to be aware of the alignment of memory accesses.

## E2.9 Mismatched memory attributes

In the ARMv8 architecture mismatched memory attributes are controlled by privileged software. For more information, see Chapter G4 *The AArch32 Virtual Memory System Architecture*.

Physical memory locations are accessed with *mismatched attributes* if all accesses to the location do not use a common definition of all of the following attributes of that location:

- Memory type, Device or Normal.
- Shareability.
- Cacheability, for the same level of the inner or outer cache, but excluding any cache allocation hints.

Collectively these are referred to as memory attributes.

**Note**

The terms *location* and *memory location* refer to any byte within the current coherency granule and are used interchangeably.

When a memory location is accessed with mismatched attributes the only software visible effects are one or more of the following:

- Uniprocessor semantics for reads and writes to that memory location might be lost. This means:
  - A read of the memory location by one agent might not return the value most recently written to that memory location by the same agent.
  - Multiple writes to the memory location by one agent with different memory attributes might not be ordered in program order.
- There might be a loss of coherency when multiple agents attempt to access a memory location.
- There might be a loss of properties derived from the memory type, as described in later bullets in this section.
- If all Load-Exclusive/Store-Exclusive instructions executed across all threads to access a given memory location do not use consistent memory attributes, the exclusive monitor state becomes UNKNOWN.
- Bytes written without the Write-Back cacheable attribute within the same Write-Back granule as bytes written with the Write-Back cacheable attribute might have their values reverted to the old values as a result of cache Write-Back.

The loss of properties associated with mismatched memory type attributes refers only to the following properties of Device memory that are additional to the properties of Normal memory:

- Prohibition of speculative read accesses.
- Prohibition on Gathering.
- Prohibition on Re-ordering.

For the following situations, when a physical memory location is accessed with mismatched attributes, a more restrictive set of behaviors applies. The description of each situation also describes the behaviors that apply:

1. If the only memory type mismatch associated with a memory location across all users of the memory location is between different types of Device memory, then all accesses might take the properties of the weakest Device memory type.
2. Any agent that reads that memory location using the same common definition of the Shareability and Cacheability attributes is guaranteed to access it coherently, to the extent required by that common definition of the memory attributes, only if all of the following conditions are met:
   - All aliases to the memory location with write permission both use a common definition of the Shareability and Cacheability attributes for the memory location, and either:
     - Have the Inner Cacheability attribute the same as the Outer Cacheability attribute.
     - In the Non-secure PL1&0 translation regime, have HCR2.MIOCNCE set to 0.
   - All aliases to a memory location use a definition of the Shareability attributes that encompasses all the agents with permission to access the location.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

3. The possible software-visible effects caused by mismatched attributes for a memory location are defined more precisely if all of the mismatched attributes define the memory location as one of:
   - Any Device memory type.
   - Normal Inner Non-cacheable, Outer Non-cacheable memory.

   In these cases, the only permitted software-visible effects of the mismatched attributes are one or more of the following:
   - Possible loss of properties derived from the memory type when multiple agents attempt to access the memory location.
   - Possible reordering of memory transactions to the same memory location with different memory attributes, potentially leading to a loss of coherency or uniprocessor semantics. Any possible loss of coherency or uniprocessor semantics can be avoided by inserting `DMB` barrier instructions between accesses to the same memory location that might use different attributes.

Where there is a loss of the uniprocessor semantics, ordering, or coherency, the following approaches can be used:

1. If the mismatched attributes for a memory location all assign the same Shareability attribute to the location, any loss of uniprocessor semantics, ordering, or coherency within a Shareability domain can be avoided by use of software cache management. To do so, software must use the techniques that are required for the software management of the ordering or coherency of cacheable locations between agents in different shareability domains. This means:
   - Before writing to a location not using the Write-Back attribute, software must invalidate, or clean, a location from the caches if any agent might have written to the location with the Write-Back attribute. This avoids the possibility of overwriting the location with stale data.
   - After writing to a location with the Write-Back attribute, software must clean the location from the caches, to make the write visible to external memory.
   - Before reading the location with a cacheable attribute, software must invalidate the location from the caches, to ensure that any value held in the caches reflects the last value made visible in external memory.
   - Executing a `DMB` barrier instruction, with scope that applies to the common Shareability of the accesses, between any accesses to the same memory location that use different attributes.

   **Note**

   In AArch32 state, cache maintenance instructions can only be accessed from an Exception level that is higher than EL0, and therefore require a system call. For information on system calls, see *Exception-generating and exception-handling instructions* on page F1-2426. For information about the AArch32 cache maintenance instructions, see *AArch32 cache and branch predictor support* on page G3-3952.

   In all cases:
   - Location refers to any byte within the current coherency granule.
   - A clean and invalidate instruction can be used instead of a clean instruction, or instead of an invalidate instruction.
   - In the sequences outlined in this section, all cache maintenance instructions and memory transactions must be completed, or ordered by the use of barrier operations, if they are not naturally ordered by the use of a common address, see *Ordering of cache and branch predictor maintenance instructions* on page G3-3969.

   **Note**

   With software management of coherency, race conditions can cause loss of data. A race condition occurs when different agents write simultaneously to bytes that are in the same location, and the invalidate, write, clean sequence of one agent overlaps with the equivalent sequence of another agent. A race condition also occurs if the first operation of either sequence is a clean, rather than an invalidate.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

2. If the mismatched attributes for a location mean that multiple cacheable accesses to the location might be made with different Shareability attributes, then ordering and coherency are guaranteed only if:
   - Each PE that accesses the location with a cacheable attribute performs a clean and invalidate of the location before and after accessing that location.
   - A `DMB` barrier with scope that covers the full Shareability of the accesses is placed between any accesses to the same memory location that use different attributes.

   **Note**

   The Note in rule 1 of this list, about possible race conditions, also applies to this rule.

In addition, if multiple agents attempt to use Load-Exclusive or Store-Exclusive instructions to access a location, and the accesses from the different agents have different memory attributes associated with the location, the exclusive monitor state becomes UNKNOWN.

ARM strongly recommends that software does not use mismatched attributes for aliases of the same location. An implementation might not optimize the performance of a system that uses mismatched aliases.

Non-Confidential - Beta

## E2.10 Synchronization and semaphores

ARMv8 provides non-blocking synchronization of shared memory, using *synchronization primitives*. The information in this section about memory accesses by synchronization primitives applies to accesses to both Normal and Device memory.

**Note**

Use of the ARMv8 synchronization primitives scales for multiprocessing system designs.

Table E2-6 shows the synchronization primitives and the associated CLREX instruction.

**Table E2-6 Synchronization primitives and associated instruction**

| Function | A32/T32 Instruction |
|---|---|
| Load-Exclusive | |
| Byte | LDREXB, LDAEXB |
| Halfword | LDREXH, LDAEXH |
| Word | LDREX, LDAEX |
| Doubleword | LDREXD. LDAEXD |
| Store-Exclusive | |
| Byte | STREXB, STLEXB |
| Halfword | STREXH, STLEXH |
| Word | STREX, STLEX |
| Doubleword | STREXD, STLEXD |
| Clear-Exclusive | CLREX |

The model for the use of a Load-Exclusive/Store-Exclusive instruction pair accessing a non-aborting memory address *x* is:

- The Load-Exclusive instruction reads a value from memory address *x*.
- The corresponding Store-Exclusive instruction succeeds in writing back to memory address *x* only if no other observer, process, or thread has performed a more recent store to address *x*. The Store-Exclusive instruction returns a status bit that indicates whether the memory write succeeded.

A Load-Exclusive instruction marks a small block of memory for exclusive access. The size of the marked block is IMPLEMENTATION DEFINED, see *Marking and the size of the marked memory block* on page E2-2401. A Store-Exclusive instruction to any address in the marked block clears the marking.

**Note**

In this section, the term PE includes any observer that can generate a Load-Exclusive or a Store-Exclusive instruction.

The following sections give more information:

- *Exclusive access instructions and Non-shareable memory locations* on page E2-2396.
- *Exclusive access instructions and shareable memory locations* on page E2-2397.
- *Marking and the size of the marked memory block* on page E2-2401.

Non-Confidential - Beta

- *Context switch support* on page E2-2401.
- *Load-Exclusive and Store-Exclusive instruction usage restrictions* on page E2-2402.
- *Use of WFE and SEV instructions by spin-locks* on page E2-2403.

### E2.10.1 Exclusive access instructions and Non-shareable memory locations

For memory locations for which the Shareability attribute is Non-shareable, the exclusive access instructions rely on a *local monitor* that marks any address from which the PE executes a Load-Exclusive instruction. Any non-aborted attempt by the same PE to use a Store-Exclusive instruction to modify any address is guaranteed to clear the marking.

A Load-Exclusive instruction performs a load from memory, and:

- The executing PE marks the physical memory address for exclusive access.
- The local monitor of the executing PE transitions to the Exclusive Access state.

A Store-Exclusive instruction performs a conditional store to memory that depends on the state of the local monitor:

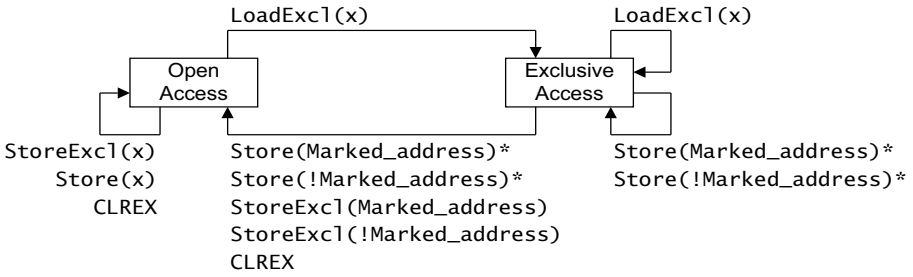
**If the local monitor is in the Exclusive Access state**

- If the address of the Store-Exclusive instruction is the same as the address that has been marked in the monitor by an earlier Load-Exclusive instruction, then the store occurs. Otherwise, it is IMPLEMENTATION DEFINED whether the store occurs.
- A status value is returned to a register:
  - If the store took place the status value is 0.
  - Otherwise, the status value is 1.
- The local monitor of the executing PE transitions to the Open Access state.

**If the local monitor is in the Open Access state**

- No store takes place.
- A status value of 1 is returned to a register.
- The local monitor remains in the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.



When a PE writes using any instruction other than a Store-Exclusive instruction:

- If the write is to a physical address that is not marked as Exclusive Access by its local monitor and that local monitor is in the Exclusive Access state it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.
- If the write is to a physical address that is marked as Exclusive Access by its local monitor it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.

It is IMPLEMENTATION DEFINED whether a store to a marked physical address causes a mark in the local monitor to be cleared if that store is by an observer other than the one that caused the physical address to be marked.

Figure E2-4 on page E2-2397 shows the state machine for the local monitor and the effect of each of the operations shown in the figure.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

Operations marked * are possible alternative IMPLEMENTATION DEFINED options.
In the diagram: `LoadExcl` represents any Load-Exclusive instruction
`StoreExcl` represents any Store-Exclusive instruction
`Store` represents any other store instruction.

Any `LoadExcl` operation updates the marked address to the most significant bits of the address x used for the operation.

**Figure E2-4 Local monitor state machine diagram**

For more information about marking see *Marking and the size of the marked memory block* on page E2-2401.

**Note**

For the local monitor state machine, as shown in Figure E2-4:

- The IMPLEMENTATION DEFINED options for the local monitor are consistent with the local monitor being constructed so that it does not hold any physical address, but instead treats any access as matching the address of the previous Load-Exclusive instruction.
- A local monitor implementation can be unaware of Load-Exclusive and Store-Exclusive instructions from other PEs.
- The architecture does not require a load instruction, by another PE, that is not a Load-Exclusive instruction, to have any effect on the local monitor.
- It is IMPLEMENTATION DEFINED whether the transition from Exclusive Access to Open Access state occurs when the `Store` or `StoreExcl` is from another observer.

### Changes to the local monitor state resulting from speculative execution

The architecture permits a local monitor to transition to the Open Access state as a result of speculation, or from some other cause. This is in addition to the transitions to Open Access state caused by the architectural execution of an operation shown in Figure E2-4.

An implementation must ensure that:

- The local monitor cannot be seen to transition to the Exclusive Access state except as a result of the architectural execution of one of the operations shown in Figure E2-4.
- Any transition of the local monitor to the Open Access state not caused by the architectural execution of an operation shown in Figure E2-4 must not indefinitely delay forward progress of execution.

## E2.10.2 Exclusive access instructions and shareable memory locations

In the context of this section, a shareable memory location is a memory location that has, or is treated as if it has, a Shareability attribute of Inner Shareable or Outer Shareable.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For shareable memory locations, exclusive access instructions rely on:

- A *local monitor* for each PE in the system, that marks any address from which the PE executes a Load-Exclusive. The local monitor operates as described in *Exclusive access instructions and Non-shareable memory locations* on page E2-2396, except that for shareable memory any Store-Exclusive is then subject to checking by the global monitor if it is described in that section as doing at least one of the following:
  - Updating memory.
  - Returning a status value of 0.

  The local monitor can ignore accesses from other PEs in the system.
- A *global monitor* that marks a physical address as exclusive access for a particular PE. This marking is used later to determine whether a Store-Exclusive to that address that has not been failed by the local monitor can occur. Any successful write to the marked block by any other observer in the Shareability domain of the memory location is guaranteed to clear the marking. For each PE in the system, the global monitor:
  - Can hold at least one marked block.
  - Maintains a state machine for each marked block it can hold.

  **Note**

  For each PE, the architecture only requires global monitor support for a single marked address. Any situation that might benefit from the use of multiple marked addresses on a single PE is UNPREDICTABLE, see *Load-Exclusive and Store-Exclusive instruction usage restrictions* on page E2-2402.

**Note**

The global monitor can either reside in a block that is part of the hardware on which the PE executes or exist as a secondary monitor at the memory interfaces. The IMPLEMENTATION DEFINED aspects of the monitors mean that the global monitor and local monitor can be combined into a single unit, provided that the unit performs the global monitor and local monitor functions defined in this manual.

For shareable memory locations, in some implementations and for some memory types, the properties of the global monitor require functionality outside the PE. Some system implementations might not implement this functionality for all locations of memory. In particular, this can apply to:

- Any type of memory in the system implementation that does not support hardware cache coherency.
- Non-cacheable memory, or memory treated as Non-cacheable, in an implementation that does support hardware cache coherency.

In such a system, it is defined by the system:

- Whether the global monitor is implemented.
- If the global monitor is implemented, which address ranges or memory types it monitors.

**Note**

To support the use of the Load-Exclusive/Store-Exclusive mechanism when address translation is disabled, a system might define at least one location of memory, of at least the size of the translation granule, in the system memory map to support the global monitor for all PEs within a common Inner Shareable domain. However, this is not an architectural requirement. Therefore, architecturally-compliant software that requires mutual exclusion must not rely on using the Load-Exclusive/Store-Exclusive mechanism, and must instead use a software algorithm such as Lamport's Bakery algorithm to achieve mutual exclusion.

Because implementations can choose which memory types are treated as Non-cacheable, the only memory types for which it is architecturally guaranteed that a global exclusive monitor is implemented are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hint and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hints and not transient.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The set of memory types that support atomic instructions must include all of the memory types for which a global monitor is implemented.

If the global monitor is not implemented for an address range or memory type, then performing a Load-Exclusive/Store-Exclusive instruction to such a location has one or more of the following effects:

- The instruction generates an external abort.
- The instruction generates an IMPLEMENTATION DEFINED MMU fault. This is reported using the Fault Status code of:
  - DFSR.STATUS = `0b110101` when using the Long-descriptor translation table format. The fault can also be reported in the HSR.ISS[5:0] field for exceptions to Hyp mode.
  - DFSR.FS = `0b10101` when using the Short-descriptor translation table format.

  If the IMPLEMENTATION DEFINED MMU fault is generated for the Non-secure PL1&0 translation regime then:
  - If the fault is generated because of the memory type defined in the first stage of translation, or if the second stage of translation is disabled, then this is a first stage fault and the exception is taken to EL1.
  - Otherwise, the fault is a second stage fault and the exception is taken to EL2.

  The priority of this fault is IMPLEMENTATION DEFINED.
- The instruction is treated as a `NOP`.
- The Load-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
- The Store-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
- The value held in the result register of the Store-Exclusive instruction becomes UNKNOWN.

In addition, for write transactions generated by non-PE observers that do not implement exclusive accesses or other atomic access mechanisms, the effect that writes have on the global and local monitors used by an ARM PE is IMPLEMENTATION DEFINED. The writes might not clear the global monitors of other PEs for:

- Some address ranges.
- Some memory types.

### Operation of the global monitor

A Load-Exclusive instruction from shareable memory performs a load from memory, and causes the physical address of the access to be marked as exclusive access for the requesting PE. This access can also cause the exclusive access mark to be removed from any other physical address that has been marked by the requesting PE.

**Note**

The global monitor only supports a single outstanding exclusive access to shareable memory for each PE.

A Load-Exclusive instruction by one PE has no effect on the global monitor state for any other PE.

A Store-Exclusive instruction performs a conditional store to memory:

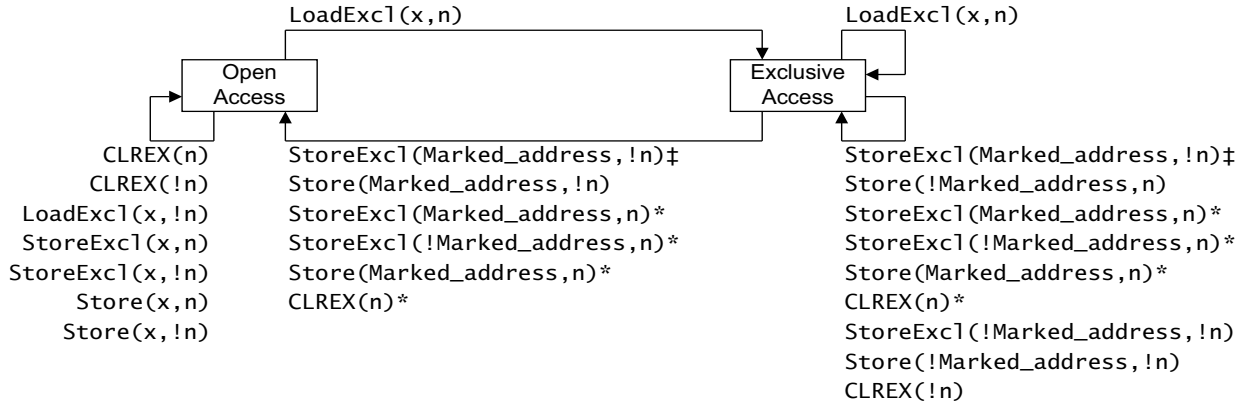
- The store is guaranteed to succeed only if the physical address accessed is marked as exclusive access for the requesting PE and both the local monitor and the global monitor state machines for the requesting PE are in the Exclusive Access state. In this case:
  - A status value of 0 is returned to a register to acknowledge the successful store.
  - The final state of the global monitor state machine for the requesting PE is IMPLEMENTATION DEFINED.
  - If the address accessed is marked for exclusive access in the global monitor state machine for any other PE then that state machine transitions to Open Access state.
- If no address is marked as exclusive access for the requesting PE, the store does not succeed:
  - A status value of 1 is returned to a register to indicate that the store failed.
  - The global monitor is not affected and remains in Open Access state for the requesting PE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- If a different physical address is marked as exclusive access for the requesting PE, it is IMPLEMENTATION DEFINED whether the store succeeds or not:
  - If the store succeeds a status value of 0 is returned to a register, otherwise a value of 1 is returned.
  - If the global monitor state machine for the PE was in the Exclusive Access state before the Store-Exclusive instruction it is IMPLEMENTATION DEFINED whether that state machine transitions to the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.

In a shared memory system, the global monitor implements a separate state machine for each PE in the system. The state machine for accesses to shareable memory by PE(n) can respond to all the shareable memory accesses visible to it. This means it responds to:



- Accesses generated by PE(n).
- Accesses generated by the other observers in the Shareability domain of the memory location. These accesses are identified as (!n).

In a shared memory system, the global monitor implements a separate state machine for each observer that can generate a Load-Exclusive or a Store-Exclusive instruction in the system.

### *Clear global monitor event*

Whenever the global monitor state for a PE changes from Exclusive access to Open access, an event is generated and held in the Event register for that PE. This register is used by the Wait for Event mechanism, see *Wait For Event and Send Event* on page G1-3834.

Figure E2-5 shows the state machine for PE(n) in a global monitor.

‡StoreExcl(Marked_address,!n) clears the monitor only if the StoreExcl updates memory
Operations marked * are possible alternative IMPLEMENTATION DEFINED options.
In the diagram: LoadExcl represents any Load-Exclusive instruction
StoreExcl represents any Store-Exclusive instruction
Store represents any other store instruction.

Any LoadExcl operation updates the marked address to the most significant bits of the address x used for the operation.

**Figure E2-5 Global monitor state machine diagram for PE(n) in a multiprocessor system**

For more information about marking see *Marking and the size of the marked memory block* on page E2-2401.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

**Note**

For the global monitor state machine, as shown in Figure E2-5 on page E2-2400:

- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the global monitor.
- Whether a Store-Exclusive instruction successfully updates memory or not depends on whether the address accessed matches the marked shareable memory address for the PE issuing the Store-Exclusive instruction, and whether the local and global monitors are in the exclusive state. For this reason, Figure E2-5 on page E2-2400 only shows how the operations by (!n) cause state transitions of the state machine for PE(n).
- A Load-Exclusive instruction can only update the marked shareable memory address for the PE issuing the Load-Exclusive instruction.
- When the global monitor is in the Exclusive Access state, it is IMPLEMENTATION DEFINED whether a `CLREX` instruction causes the global monitor to transition from Exclusive Access to Open Access state.
- It is IMPLEMENTATION DEFINED:
  - Whether a modification to a Non-shareable memory location can cause a global monitor to transition from Exclusive Access to Open Access state.
  - Whether a Load-Exclusive instruction to a Non-shareable memory location can cause a global monitor to transition from Open Access to Exclusive Access state.

### E2.10.3 Marking and the size of the marked memory block

When a Load-Exclusive instruction is executed, the resulting marked block ignores the least significant bits of the 64-bit memory address.

When a Load-Exclusive instruction is executed, a marked block of size $2^a$ bytes is created by ignoring the least significant bits of the memory address. A marked address is any address within this marked block. The size of the marked memory block is called the *Exclusives reservation granule*. The Exclusives reservation granule is IMPLEMENTATION DEFINED in the range 4 - 512 words.

**Note**

This definition means that the Exclusives reservation granule is:

- 4 words in an implementation where $a$ is 4.
- 512 words in an implementation where $a$ is 11.

For example, in an implementation where $a$ is 4, a successful `LDREXB` of address `0x341B4` defines a marked block using bits[47:4] of the address. This means that the four words of memory from `0x341B0` to `0x341BF` are marked for exclusive access.

In some implementations the CTR identifies the Exclusives reservation granule, see CTR. Otherwise, software must assume that the maximum Exclusives reservation granule, 512 words, is implemented.

### E2.10.4 Context switch support

An exception return clears the local monitor. As a result, performing a `CLREX` instruction as part of a context switch is not required in most situations.

**Note**

Context switching is not an application level operation. However, this information is included here to complete the description of the exclusive operations.

Non-Confidential - Beta

### E2.10.5 Load-Exclusive and Store-Exclusive instruction usage restrictions

The Load-Exclusive and Store-Exclusive instructions are intended to work together as a pair, for example a `LDREX`/`STREX` pair or a `LDREXB`/`STREXB` pair. To support different implementations of these functions, software must follow the notes and restrictions given in this subsection.

The following notes describe use of a Load-Exclusive/ Store-Exclusive pair, `LoadExcl`/`StoreExcl`, to indicate the use of any of the Load-Exclusive/Store-Exclusive instruction pairs shown in Table E2-6 on page E2-2395:

- The exclusives support a single outstanding exclusive access for each software thread that is executed. The architecture makes use of this by not requiring an address or size check as part of the `IsExclusiveLocal()` function. If the target virtual address of a `StoreExcl` is different from the virtual address of the preceding `LoadExcl` instruction in the same thread of execution, behavior can be UNPREDICTABLE. As a result, a `LoadExcl`/`StoreExcl` pair can only be relied upon to eventually succeed if the `LoadExcl` and the `StoreExcl` are executed with the same virtual address.
- If two `StoreExcl` instructions are executed without an intervening `LoadExcl` instruction the second `StoreExcl` instruction returns a status value of 1. This means that:
  — ARM recommends that, in a given thread of execution, every `StoreExcl` instruction has a preceding `LoadExcl` instruction associated with it.

  It is not necessary for every `LoadExcl` instruction to have a subsequent `StoreExcl` instruction.
- An implementation of the Load-Exclusive and Store-Exclusive instructions can require that, in any thread of execution, the transaction size of a Store-Exclusive instruction is the same as the transaction size of the preceding Load-Exclusive instruction executed in that thread. If the transaction size of a Store-Exclusive instruction is different from the preceding Load-Exclusive instruction in the same thread of execution, behavior can be UNPREDICTABLE. As a result, software can rely on an `LoadExcl`/`StoreExcl` pair to eventually succeed only if they have the same size.
- An implementation might clear an exclusive monitor between the `LoadExcl` instruction and the `StoreExcl`, instruction without any application-related cause. For example, this might happen because of cache evictions. Software must, in any single thread of execution, avoid having any explicit memory accesses, System register updates, or cache maintenance instructions between the `LoadExcl` instruction and the associated `StoreExcl` instruction.
- Implementations can benefit from keeping the `LoadExcl` and `StoreExcl` operations close together in a single thread of execution. This minimizes the likelihood of the exclusive monitor state being cleared between the `LoadExcl` instruction and the `StoreExcl` instruction. Therefore, for best performance, ARM strongly recommends a limit of 128 bytes between `LoadExcl` and `StoreExcl` instructions in a single thread of execution.
- The architecture sets an upper limit of 2048 bytes on the exclusive reservation granule that can be marked as exclusive. For performance reasons, ARM recommends that objects that are accessed by exclusive accesses are separated by the size of the exclusive reservations granule. This is a performance guideline rather than a functional requirement.
- After taking a Data Abort exception, the state of the exclusive monitors is UNKNOWN.
- For the memory location accessed by a `LoadExcl`/`StoreExcl` pair, if the memory attributes for the `LoadExcl` instruction differ from the memory attributes for the `StoreExcl` instruction, behavior is UNPREDICTABLE.

  This can occur either:

  — Because the translation of the accessed address changes between the `LoadExcl` instruction and the `StoreExcl` instruction.

  — As a result of using different virtual addresses, with different attributes, that point to the same physical address. This case is covered by another bullet point in this list.
- The effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global exclusive monitor that is in the Exclusive Access state is UNPREDICTABLE. The instruction might clear the monitor, or it might leave it in the Exclusive Access state. For address-based maintenance instructions, this also applies to the monitors of other PEs in the same Shareability domain as the PE executing the cache maintenance instruction, as determined by the Shareability domain of the address being maintained.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

ARM strongly recommends that implementations ensure that the use of such maintenance instructions by a PE in the Non-secure state cannot cause a denial of service on a PE in the Secure state.

- If the mapping of the virtual to physical address is changed between the LDREX instruction and the STREX instruction, and the change is performed using a break-before-make sequence as described in *Using break-before-make when updating translation table entries* on page G4-4062, if the STREX is performed after another write to the same physical address as the STREX, and that other write was performed after the old translation was properly invalidated and that invalidation was properly synchronized, then the STREX will not pass its monitor check.

  **Note**

  ARM expects that, in many implementations, either:

  — The TLB invalidation will clear either the local or global monitor.

  — The physical address will be checked between the LDREX and STREX.

**Note**

In the event of repeatedly-contending Load-Exclusive/Store-Exclusive instruction sequences from multiple PEs, an implementation must ensure that forward progress is made by at least one PE.

### E2.10.6 Use of WFE and SEV instructions by spin-locks

ARMv8 provides Wait For Event, Send Event, and Send Event Local instructions, WFE, SEV, SEVL, that can assist with reducing power consumption and bus contention caused by PEs repeatedly attempting to obtain a spin-lock. These instructions can be used at the application level, but a complete understanding of what they do depends on a system level understanding of exceptions. They are described in *Wait For Event and Send Event* on page G1-3834. However, in ARMv8, when the global monitor for a PE changes from Exclusive Access state to Open Access state, an event is generated.

**Note**

This is equivalent to issuing an SEV instruction on the PE for which the monitor state has changed. It removes the need for spinlock code to include an SEV instruction after clearing a spinlock.

# Part F
## The AArch32 Instruction Sets

# Chapter F1
# The AArch32 Instruction Sets Overview

This chapter describes the T32 and A32 instruction sets. It contains the following sections:

- *Support for instructions in different versions of the ARM architecture* on page F1-2408.
- *Unified Assembler Language* on page F1-2409.
- *Branch instructions* on page F1-2411.
- *Data-processing instructions* on page F1-2412.
- *PSTATE and banked register access instructions* on page F1-2420.
- *Load/store instructions* on page F1-2421.
- *Load/store multiple instructions* on page F1-2424.
- *Miscellaneous instructions* on page F1-2425.
- *Exception-generating and exception-handling instructions* on page F1-2426.
- *Coprocessor instructions* on page F1-2427.
- *Advanced SIMD and floating-point load/store instructions* on page F1-2428.
- *Advanced SIMD and floating-point register transfer instructions* on page F1-2430.
- *Advanced SIMD data-processing instructions* on page F1-2431.
- *Floating-point data-processing instructions* on page F1-2439.

*Non-Confidential - Beta*

## F1.1 Support for instructions in different versions of the ARM architecture

This manual describes the ARM AArch32 instruction sets, T32 and A32, for the ARMv8 architecture. Therefore, it indicates how any options or extensions in the ARMv8 architecture affect the available instructions. Also, Appendix K5 *ARMv8 Changes to the T32 and A32 Instruction Sets* provides information for those migrating from earlier versions of the architecture.

This manual does not provide any information about which T32 and A32 instructions were supported in specific earlier versions of the architecture. For this information, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F1.2 Unified Assembler Language

This manual uses the ARM *Unified Assembler Language* (UAL). This assembly language syntax provides a canonical form for all T32 and A32 instructions.

UAL describes the syntax for the mnemonic and the operands of each instruction. In addition, it assumes that instructions and data items can be given labels. It does not specify the syntax to be used for labels, nor what assembler directives and options are available. See your assembler documentation for these details.

Most earlier ARM assembly language mnemonics are still supported as synonyms, as described in the instruction details.

**Note**

Most earlier T32 assembly language mnemonics are *not* supported.

UAL includes *instruction selection* rules that specify which instruction encoding is selected when more than one can provide the required functionality. For example, both 16-bit and 32-bit encodings exist for an `ADD R0, R1, R2` instruction. The most common instruction selection rule is that when both a 16-bit encoding and a 32-bit encoding are available, the 16-bit encoding is selected, to optimize code density.

Syntax options exist to override the normal instruction selection rules and ensure that a particular encoding is selected. These are useful when disassembling code, to ensure that subsequent assembly produces the original code, and in some other situations.

### F1.2.1 Conditional instructions

For maximum portability of UAL assembly language between the T32 and A32 instruction sets, ARM recommends that:

- `IT` instructions are written before conditional instructions in the correct way for the T32 instruction set.
- When assembling to the A32 instruction set, assemblers check that any `IT` instructions are correct, but do not generate any code for them.

Although other T32 instructions are unconditional, all instructions that are made conditional by an `IT` instruction must be written with a condition. These conditions must match the conditions imposed by the `IT` instruction. For example, an `ITTEE EQ` instruction imposes the `EQ` condition on the first two following instructions, and the `NE` condition on the next two. Those four instructions must be written with `EQ`, `EQ`, `NE` and `NE` conditions respectively.

Some instructions cannot be made conditional by an `IT` instruction. Some instructions can be conditional if they are the last instruction in the IT block, but not otherwise.

The branch instruction encodings that include a condition code field cannot be made conditional by an `IT` instruction. If the assembler syntax indicates a conditional branch that correctly matches a preceding `IT` instruction, it is assembled using a branch instruction encoding that does not include a condition code field.

### F1.2.2 Use of labels in UAL instruction syntax

The UAL syntax for some instructions includes the label of an instruction or a literal data item that is at a fixed offset from the instruction being specified. The assembler must:

1. Calculate the `PC` or `Align(PC, 4)` value of the instruction. The `PC` value of an instruction is its address plus 4 for a T32 instruction, or plus 8 for an A32 instruction. The `Align(PC, 4)` value of an instruction is its `PC` value ANDed with `0xFFFFFFFC` to force it to be word-aligned. There is no difference between the `PC` and `Align(PC, 4)` values for an A32 instruction, but there can be for a T32 instruction.
2. Calculate the offset from the `PC` or `Align(PC, 4)` value of the instruction to the address of the labeled instruction or literal data item.
3. Assemble a *PC-relative* encoding of the instruction, that is, one that reads its `PC` or `Align(PC, 4)` value and adds the calculated offset to form the required address.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Note**

For instructions that can encode a subtraction operation, if the instruction cannot encode the calculated offset but can encode minus the calculated offset, the instruction encoding specifies a subtraction of minus the calculated offset.

The syntax of the following instructions includes a label:

- `B`, `BL`, and `BLX` (immediate). The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a sign-extended immediate offset that is added to the `PC` value of the instruction to form the target address of the branch.
- `CBNZ` and `CBZ`. The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a zero-extended immediate offset that is added to the `PC` value of the instruction to form the target address of the branch. They do not support backward branches.
- `LDC`, `LDC2`, `LDR`, `LDRB`, `LDRD`, `LDRH`, `LDRSB`, `LDRSH`, `PLD`, `PLDW`, `PLI`, and `VLDR`. The normal assembler syntax of these load instructions can specify the label of a literal data item that is to be loaded. The encodings of these instructions specify a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item. A few such encodings perform a fixed addition or a fixed subtraction and must only be used when that operation is required, but most contain a bit that specifies whether the offset is to be added or subtracted.

  When the assembler calculates an offset of 0 for the normal syntax of these instructions, it must assemble an encoding that adds 0 to the `Align(PC, 4)` value of the instruction. Encodings that subtract 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

  There is an alternative syntax for these instructions that specifies the addition or subtraction and the immediate offset explicitly. In this syntax, the label is replaced by `[PC, #+/-<imm>]`, where:

  `+/-` Is `+` or omitted to specify that the immediate offset is to be added to the `Align(PC, 4)` value, or `-` if it is to be subtracted.

  `<imm>` Is the immediate offset.

  This alternative syntax makes it possible to assemble the encodings that subtract 0 from the `Align(PC, 4)` value, and to disassemble them to a syntax that can be re-assembled correctly.
- `ADR`. The normal assembler syntax for this instruction can specify the label of an instruction or literal data item whose address is to be calculated. Its encoding specifies a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item, and some opcode bits that determine whether it is an addition or subtraction.

  When the assembler calculates an offset of 0 for the normal syntax of this instruction, it must assemble the encoding that adds 0 to the `Align(PC, 4)` value of the instruction. The encoding that subtracts 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

  There is an alternative syntax for this instruction that specifies the addition or subtraction and the immediate value explicitly, by writing them as additions `ADD <Rd>, PC, #<imm>` or subtractions `SUB <Rd>, PC, #<imm>`. This alternative syntax makes it possible to assemble the encoding that subtracts 0 from the `Align(PC, 4)` value, and to disassemble it to a syntax that can be re-assembled correctly.

**Note**

ARM recommends that where possible, software avoids using:

- The alternative syntax for the `ADR`, `LDC`, `LDC2`, `LDR`, `LDRB`, `LDRD`, `LDRH`, `LDRSB`, `LDRSH`, `PLD`, `PLI`, `PLDW`, and `VLDR` instructions.
- The encodings of these instructions that subtract 0 from the `Align(PC, 4)` value.

## F1.3 Branch instructions

Table F1-1 summarizes the branch instructions in the T32 and A32 instruction sets. In addition to providing for changes in the flow of execution, some branch instructions can change instruction set.

**Table F1-1 Branch instructions**

| Instruction | See | Range, T32 | Range, A32 |
|---|---|---|---|
| Branch to target address | *B* on page F6-2623 | ±16MB | ±32MB |
| Compare and Branch on Nonzero,<br>Compare and Branch on Zero | *CBNZ, CBZ* on page F6-2646 | 0-126 bytes | [a] |
| Call a subroutine<br>Call a subroutine, change instruction set[b] | *BL, BLX (immediate)* on page F6-2639 | ±16MB<br>±16MB | ±32MB<br>±32MB |
| Call a subroutine, optionally change instruction set | *BLX (register)* on page F6-2641 | Any | Any |
| Branch to target address, change instruction set | *BX* on page F6-2643 | Any | Any |
| Change to Jazelle state | *BXJ* on page F6-2645 | - | - |
| Table Branch (byte offsets)<br>Table Branch (halfword offsets) | *TBB, TBH* on page F6-3117 | 0-510 bytes<br>0-131070 bytes | [a] |

a. These instructions do not exist in the A32 instruction set.

b. The range is determined by the instruction set of the `BLX` instruction, not of the instruction it branches to.

Branches to loaded and calculated addresses can be performed by `LDR`, `LDM` and data-processing instructions. For details see *Load/store instructions* on page F1-2421, *Load/store multiple instructions* on page F1-2424, *Standard data-processing instructions* on page F1-2412, and *Shift instructions* on page F1-2414.

In addition to the branch instructions shown in Table F1-1:

- In the A32 instruction set, a data-processing instruction that targets the PC behaves as a branch instruction. For more information, see *Data-processing instructions* on page F1-2412.
- In the T32 and A32 instruction sets, a load instruction that targets the PC behaves as a branch instruction. For more information, see *Load/store instructions* on page F1-2421.

## F1.4 Data-processing instructions

Core data-processing instructions belong to one of the following groups:

- *Standard data-processing instructions*.

  These instructions perform basic data-processing operations, and share a common format with some variations.
- *Shift instructions* on page F1-2414.
- *Multiply instructions* on page F1-2414.
- *Saturating instructions* on page F1-2416.
- *Saturating addition and subtraction instructions* on page F1-2416.
- *Packing and unpacking instructions* on page F1-2417.
- *Parallel addition and subtraction instructions* on page F1-2418.
- *Divide instructions* on page F1-2419.
- *Miscellaneous data-processing instructions* on page F1-2419.

For related Advanced SIMD and floating-point instructions see *Advanced SIMD data-processing instructions* on page F1-2431 and *Floating-point data-processing instructions* on page F1-2439.

### F1.4.1 Standard data-processing instructions

These instructions generally have a destination register Rd, a first operand register Rn, and a second operand. The second operand can be another register Rm, or an immediate constant.

If the second operand is an immediate constant, it can be:

- Encoded directly in the instruction.
- A *modified immediate constant* that uses 12 bits of the instruction to encode a range of constants. T32 and A32 instructions have slightly different ranges of modified immediate constants. For more information, see *Modified immediate constants in T32 instructions* on page F2-2459 and *Modified immediate constants in A32 instructions* on page F2-2456.

If the second operand is another register, it can optionally be shifted in any of the following ways:

`LSL` Logical Shift Left by 1-31 bits.

`LSR` Logical Shift Right by 1-32 bits.

`ASR` Arithmetic Shift Right by 1-32 bits.

`ROR` Rotate Right by 1-31 bits.

`RRX` Rotate Right with Extend. For details see *Shift and rotate operations* on page E1-2312.

In T32 code, the amount to shift by is always a constant encoded in the instruction. In A32 code, the amount to shift by is either a constant encoded in the instruction, or the value of a register, Rs.

For instructions other than `CMN`, `CMP`, `TEQ`, and `TST`, the result of the data-processing operation is placed in the destination register. In the A32 instruction set, the destination register can be the PC, causing the result to be treated as a branch address. In the T32 instruction set, this is only permitted for some 16-bit forms of the `ADD` and `MOV` instructions.

These instructions can optionally set the condition flags, according to the result of the operation. If they do not set the flags, existing flag settings from a previous instruction are preserved.

Table F1-2 on page F1-2413 summarizes the main data-processing instructions in the T32 and A32 instruction sets. Generally, each of these instructions is described in three sections in Chapter F2 *About the T32 and A32 Instruction Descriptions*, one section for each of the following:

- `INSTRUCTION` (immediate) where the second operand is a modified immediate constant.
- `INSTRUCTION` (register) where the second operand is a register, or a register shifted by a constant.
- `INSTRUCTION` (register-shifted register) where the second operand is a register shifted by a value obtained from another register. These are only available in the A32 instruction set.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table F1-2 Standard data-processing instructions**

| Instruction | Mnemonic | Notes |
|---|---|---|
| Add with Carry | ADC | - |
| Add | ADD | T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant. |
| Form PC-relative Address | ADR | First operand is the PC. Second operand is an immediate constant. T32 instruction set uses a zero-extended 12-bit immediate constant. Operation is an addition or a subtraction. |
| Bitwise AND | AND | - |
| Bitwise Bit Clear | BIC | - |
| Compare Negative | CMN | Sets flags. Like ADD but with no destination register. |
| Compare | CMP | Sets flags. Like SUB but with no destination register. |
| Bitwise Exclusive OR | EOR | - |
| Copy operand to destination | MOV | Has only one operand, with the same options as the second operand in most of these instructions. If the operand is a shifted register, the instruction is an LSL, LSR, ASR, or ROR instruction instead. For details see *Shift instructions* on page F1-2414.<br>The T32 and A32 instruction sets permit use of a modified immediate constant or a zero-extended 16-bit immediate constant. |
| Bitwise NOT | MVN | Has only one operand, with the same options as the second operand in most of these instructions. |
| Bitwise OR NOT | ORN | Not available in the A32 instruction set. |
| Bitwise OR | ORR | - |
| Reverse Subtract | RSB | Subtracts first operand from second operand. This permits subtraction from constants and shifted registers. |
| Reverse Subtract with Carry | RSC | Not available in the T32 instruction set. |
| Subtract with Carry | SBC | - |
| Subtract | SUB | T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant. |
| Test Equivalence | TEQ | Sets flags. Like EOR but with no destination register. |
| Test | TST | Sets flags. Like AND but with no destination register. |

Non-Confidential - Beta

### F1.4.2 Shift instructions

Table F1-3 lists the shift instructions in the T32 and A32 instruction sets.

**Table F1-3 Shift instructions**

| Instruction | See |
|---|---|
| Arithmetic Shift Right | *ASR (immediate)* on page F6-2615<br>*ASR (register)* on page F6-2617<br>*ASRS (immediate)* on page F6-2619<br>*ASRS (register)* on page F6-2621 |
| Logical Shift Left | *LSL (immediate)* on page F6-2785<br>*LSL (register)* on page F6-2787<br>*LSLS (immediate)* on page F6-2789<br>*LSLS (register)* on page F6-2791 |
| Logical Shift Right | *LSR (immediate)* on page F6-2793<br>*LSR (register)* on page F6-2795<br>*LSRS (immediate)* on page F6-2797<br>*LSRS (register)* on page F6-2799 |
| Rotate Right | *ROR (immediate)* on page F6-2917<br>*ROR (register)* on page F6-2919<br>*RORS (immediate)* on page F6-2921<br>*RORS (register)* on page F6-2923 |
| Rotate Right with Extend | *RRX* on page F6-2925<br>*RRXS* on page F6-2927 |

In the A32 instruction set only, the destination register of these instructions can be the PC, causing the result to be treated as an address to branch to.

### F1.4.3 Multiply instructions

These instructions can operate on signed or unsigned quantities. In some types of operation, the results are the same whether the operands are signed or unsigned.

- Table F1-4 summarizes the multiply instructions where there is no distinction between signed and unsigned quantities.

  The least significant 32 bits of the result are used. More significant bits are discarded.
- Table F1-5 on page F1-2415 summarizes the signed multiply instructions.
- Table F1-6 on page F1-2415 summarizes the unsigned multiply instructions.

**Table F1-4 General multiply instructions**

| Instruction | See | Operation (number of bits) |
|---|---|---|
| Multiply Accumulate | *MLA, MLAS* on page F6-2806 | 32 = 32 + 32 × 32 |
| Multiply and Subtract | *MLS* on page F6-2808 | 32 = 32 – 32 × 32 |
| Multiply | *MUL, MULS* on page F6-2842 | 32 = 32 × 32 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table F1-5 Signed multiply instructions**

| Instruction | See | Operation (number of bits) |
|---|---|---|
| Signed Multiply Accumulate (halfwords) | *SMLABB, SMLABT, SMLATB, SMLATT* on page F6-2981 | 32 = 32 + 16 × 16 |
| Signed Multiply Accumulate Dual | *SMLAD, SMLADX* on page F6-2983 | 32 = 32 + 16 × 16 + 16 × 16 |
| Signed Multiply Accumulate Long | *SMLAL, SMLALS* on page F6-2985 | 64 = 64 + 32 × 32 |
| Signed Multiply Accumulate Long (halfwords) | *SMLALBB, SMLALBT, SMLALTB, SMLALTT* on page F6-2987 | 64 = 64 + 16 × 16 |
| Signed Multiply Accumulate Long Dual | *SMLALD, SMLALDX* on page F6-2989 | 64 = 64 + 16 × 16 + 16 × 16 |
| Signed Multiply Accumulate (word by halfword) | *SMLAWB, SMLAWT* on page F6-2991 | 32 = 32 + 32 × 16 [a] |
| Signed Multiply Subtract Dual | *SMLSD, SMLSDX* on page F6-2993 | 32 = 32 + 16 × 16 – 16 × 16 |
| Signed Multiply Subtract Long Dual | *SMLSLD, SMLSLDX* on page F6-2995 | 64 = 64 + 16 × 16 – 16 × 16 |
| Signed Most Significant Word Multiply Accumulate | *SMMLA, SMMLAR* on page F6-2997 | 32 = 32 + 32 × 32 [b] |
| Signed Most Significant Word Multiply Subtract | *SMMLS, SMMLSR* on page F6-2999 | 32 = 32 – 32 × 32 [b] |
| Signed Most Significant Word Multiply | *SMMUL, SMMULR* on page F6-3001 | 32 = 32 × 32 [b] |
| Signed Dual Multiply Add | *SMUAD, SMUADX* on page F6-3003 | 32 = 16 × 16 + 16 × 16 |
| Signed Multiply (halfwords) | *SMULBB, SMULBT, SMULTB, SMULTT* on page F6-3005 | 32 = 16 × 16 |
| Signed Multiply Long | *SMULL, SMULLS* on page F6-3007 | 64 = 32 × 32 |
| Signed Multiply (word by halfword) | *SMULWB, SMULWT* on page F6-3009 | 32 = 32 × 16 [a] |
| Signed Dual Multiply Subtract | *SMUSD, SMUSDX* on page F6-3011 | 32 = 16 × 16 – 16 × 16 |

a. The most significant 32 bits of the 48-bit product are used. Less significant bits are discarded.
b. The most significant 32 bits of the 64-bit product are used. Less significant bits are discarded.

**Table F1-6 Unsigned multiply instructions**

| Instruction | See | Operation (number of bits) |
|---|---|---|
| Unsigned Multiply Accumulate Accumulate Long | *UMAAL* on page F6-3152 | 64 = 32 + 32 + 32 × 32 |
| Unsigned Multiply Accumulate Long | *UMLAL, UMLALS* on page F6-3154 | 64 = 64 + 32 × 32 |
| Unsigned Multiply Long | *UMULL, UMULLS* on page F6-3156 | 64 = 32 × 32 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F1.4.4 Saturating instructions

Table F1-7 lists the saturating instructions in the T32 and A32 instruction sets. For more information, see *Pseudocode description of saturation* on page E1-2315.

**Table F1-7 Saturating instructions**

| Instruction | See | Operation |
|---|---|---|
| Signed Saturate | *SSAT* on page F6-3016 | Saturates optionally shifted 32-bit value to selected range |
| Signed Saturate 16 | *SSAT16* on page F6-3018 | Saturates two 16-bit values to selected range |
| Unsigned Saturate | *USAT* on page F6-3174 | Saturates optionally shifted 32-bit value to selected range |
| Unsigned Saturate 16 | *USAT16* on page F6-3176 | Saturates two 16-bit values to selected range |

### F1.4.5 Saturating addition and subtraction instructions

Table F1-8 lists the saturating addition and subtraction instructions in the T32 and A32 instruction sets. For more information, see *Pseudocode description of saturation* on page E1-2315.

**Table F1-8 Saturating addition and subtraction instructions**

| Instruction | See | Operation |
|---|---|---|
| Saturating Add | *QADD* on page F6-2887 | Add, saturating result to the 32-bit signed integer range |
| Saturating Subtract | *QSUB* on page F6-2901 | Subtract, saturating result to the 32-bit signed integer range |
| Saturating Double and Add | *QADD* on page F6-2887 | Doubles one value and adds a second value, saturating the doubling and the addition to the 32-bit signed integer range |
| Saturating Double and Subtract | *QDSUB* on page F6-2897 | Doubles one value and subtracts the result from a second value, saturating the doubling and the subtraction to the 32-bit signed integer range |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F1.4.6 Packing and unpacking instructions

Table F1-9 lists the packing and unpacking instructions in the T32 and A32 instruction sets.

**Table F1-9 Packing and unpacking instructions**

| Instruction | See | Operation |
|---|---|---|
| Pack Halfword | *PKHBT, PKHTB* on page F6-2864 | Combine halfwords |
| Signed Extend and Add Byte | *SXTAB* on page F6-3105 | Extend 8 bits to 32 and add |
| Signed Extend and Add Byte 16 | *SXTAB16* on page F6-3107 | Dual extend 8 bits to 16 and add |
| Signed Extend and Add Halfword | *SXTAH* on page F6-3109 | Extend 16 bits to 32 and add |
| Signed Extend Byte | *SXTB* on page F6-3111 | Extend 8 bits to 32 |
| Signed Extend Byte 16 | *SXTB16* on page F6-3113 | Dual extend 8 bits to 16 |
| Signed Extend Halfword | *SXTH* on page F6-3115 | Extend 16 bits to 32 |
| Unsigned Extend and Add Byte | *UXTAB* on page F6-3184 | Extend 8 bits to 32 and add |
| Unsigned Extend and Add Byte 16 | *UXTAB16* on page F6-3186 | Dual extend 8 bits to 16 and add |
| Unsigned Extend and Add Halfword | *UXTAH* on page F6-3188 | Extend 16 bits to 32 and add |
| Unsigned Extend Byte | *UXTB* on page F6-3190 | Extend 8 bits to 32 |
| Unsigned Extend Byte 16 | *UXTB16* on page F6-3192 | Dual extend 8 bits to 16 |
| Unsigned Extend Halfword | *UXTH* on page F6-3194 | Extend 16 bits to 32 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F1.4.7 Parallel addition and subtraction instructions

These instructions perform additions and subtractions on the values of two registers and write the result to a destination register, treating the register values as sets of two halfwords or four bytes. That is, they perform SIMD additions or subtractions on the general-purpose registers.

These instructions consist of a prefix followed by a main instruction mnemonic. The prefixes are as follows:

`S` Signed arithmetic modulo $2^8$ or $2^{16}$.

`Q` Signed saturating arithmetic.

`SH` Signed arithmetic, halving the results.

`U` Unsigned arithmetic modulo $2^8$ or $2^{16}$.

`UQ` Unsigned saturating arithmetic.

`UH` Unsigned arithmetic, halving the results.

The main instruction mnemonics are as follows:

`ADD16` Adds the top halfwords of two operands to form the top halfword of the result, and the bottom halfwords of the same two operands to form the bottom halfword of the result.

`ASX` Exchanges halfwords of the second operand, and then adds top halfwords and subtracts bottom halfwords.

`SAX` Exchanges halfwords of the second operand, and then subtracts top halfwords and adds bottom halfwords.

`SUB16` Subtracts each halfword of the second operand from the corresponding halfword of the first operand to form the corresponding halfword of the result.

`ADD8` Adds each byte of the second operand to the corresponding byte of the first operand to form the corresponding byte of the result.

`SUB8` Subtracts each byte of the second operand from the corresponding byte of the first operand to form the corresponding byte of the result.

The instruction set permits all 36 combinations of prefix and main instruction operand, as Table F1-10 shows.

See also *Advanced SIMD parallel addition and subtraction* on page F1-2432.

**Table F1-10 Parallel addition and subtraction instructions**

| Main instruction | Signed | Saturating | Signed halving | Unsigned | Unsigned saturating | Unsigned halving |
|---|---|---|---|---|---|---|
| `ADD16`, add, two halfwords | `SADD16` | `QADD16` | `SHADD16` | `UADD16` | `UQADD16` | `UHADD16` |
| `ASX`, add and subtract with exchange | `SASX` | `QASX` | `SHASX` | `UASX` | `UQASX` | `UHASX` |
| `SAX`, subtract and add with exchange | `SSAX` | `QSAX` | `SHSAX` | `USAX` | `UQSAX` | `UHSAX` |
| `SUB16`, subtract, two halfwords | `SSUB16` | `QSUB16` | `SHSUB16` | `USUB16` | `UQSUB16` | `UHSUB16` |
| `ADD8`, add, four bytes | `SADD8` | `QADD8` | `SHADD8` | `UADD8` | `UQADD8` | `UHADD8` |
| `SUB8`, subtract, four bytes | `SSUB8` | `QSUB8` | `SHSUB8` | `USUB8` | `UQSUB8` | `UHSUB8` |

### F1.4.8 Divide instructions

In ARMv8, signed and unsigned integer divide instructions are included in both the T32 instruction set and the A32 instruction set. For more information about their implementation in previous versions of the ARM architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

For descriptions of the instructions see:

- *SDIV* on page F6-2958.
- *UDIV* on page F6-3138.

For the `SDIV` and `UDIV` instructions, divide-by-zero always returns a zero result.

The ID_ISAR0.Divide_instrs field indicates the level of support for these instructions. The field value of `0b0010` indicates they are implemented in both the T32 and A32 instruction sets.

### F1.4.9 Miscellaneous data-processing instructions

Table F1-11 lists the miscellaneous data-processing instructions in the T32 and A32 instruction sets. Immediate values in these instructions are simple binary numbers.

**Table F1-11 Miscellaneous data-processing instructions**

| Instruction | See | Notes |
|---|---|---|
| BitField Clear | *BFC* on page F6-2626 | - |
| BitField Insert | *BFI* on page F6-2628 | - |
| Count Leading Zeros | *CLZ* on page F6-2650 | - |
| Move Top | *MOVT* on page F6-2823 | Moves 16-bit immediate value to top halfword. Bottom halfword unchanged. |
| Reverse Bits | *RBIT* on page F6-2907 | - |
| Byte-Reverse Word | *REV* on page F6-2909 | - |
| Byte-Reverse Packed Halfword | *REV16* on page F6-2911 | - |
| Byte-Reverse Signed Halfword | *REVSH* on page F6-2913 | - |
| Signed BitField Extract | *SBFX* on page F6-2956 | - |
| Select Bytes using GE flags | *SEL* on page F6-2960 | - |
| Unsigned BitField Extract | *UBFX* on page F6-3134 | - |
| Unsigned Sum of Absolute Differences | *USAD8* on page F6-3170 | - |
| Unsigned Sum of Absolute Differences and Accumulate | *USADA8* on page F6-3172 | - |

## F1.5 PSTATE and banked register access instructions

These instructions transfer PE state information to or from a general-purpose register.

### F1.5.1 PSTATE access instructions

PSTATE holds process state information, see *Process state, PSTATE* on page E1-2319. In AArch32 state:

- At EL1 or higher, PSTATE is accessible using the *Current Program Status Register* (CPSR).
- At EL0, a subset of the CPSR is accessible as the *Application Program Status Register* (APSR).
- On taking an exception, the contents of the CPSR are copied to the *Saved Program Status Register* (SPSR) of the mode from which the exception is taken.

The `MRS` and `MSR` instructions move the contents of the CPSR, APSR, or the SPSR of the current mode to or from a general-purpose register, see:

- *MRS* on page F6-2830.
- *MSR (immediate)* on page F6-2838.
- *MSR (register)* on page F6-2840.

When executed at EL0, `MRS` and `MSR` instructions can only access the APSR.

The PSTATE condition flags, PSTATE.{N, Z, C, V} are set by the execution of data-processing instructions, and can control the execution of conditional instructions. However, software can set the condition flags explicitly using the `MSR` instruction, and can read the current state of the condition flags explicitly using the `MRS` instruction.

In addition, at EL1 or higher, software can use the `CPS` instruction to change the PSTATE.M field and the PSTATE.{A, I, F} interrupt mask bits, see *CPS, CPSID, CPSIE* on page F6-2662.

### F1.5.2 Banked register access instructions

At EL1 or higher, the `MRS` (Banked register) and `MSR` (Banked register) instructions move the contents of a Banked general-purpose register, the SPSR, or the ELR_hyp, to or from a general-purpose register. See:

- *MRS (Banked register)* on page F6-2832.
- *MSR (Banked register)* on page F6-2835.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F1.6 Load/store instructions

Table F1-12 summarizes the general-purpose register load/store instructions in the T32 and A32 instruction sets. Some of these instructions can also operate on the PC. See also:

- *Load/store multiple instructions* on page F1-2424.
- *Synchronization and semaphores* on page E2-2395, for more information about the Load-Exclusive and Store-Exclusive instructions.
- *Load-Acquire, Store-Release* on page E2-2378, for more information about the Load-Acquire/Store-Release and Load-Acquire Exclusive/Store-Release Exclusive instructions.
- *Advanced SIMD and floating-point load/store instructions* on page F1-2428.

Load/store instructions have several options for addressing memory. For more information, see *Addressing modes* on page F1-2422.

**Table F1-12 Load/store instructions**

| Data type | Load | Store | Unprivileged | | Exclusive | | Load-Acquire | Store-Release | Exclusive | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | Load | Store | Load | Store | | | Load-Acquire | Store-Release |
| 32-bit word | LDR | STR | LDRT | STRT | LDREX | STREX | LDA | STL | LDAEX | STLEX |
| 16-bit halfword | - | STRH | - | STRHT | - | STREXH | LDAH | STLH | LDAEXH | STLEXH |
| 16-bit unsigned halfword | LDRH | - | LDRHT | - | LDREXH | - | - | - | - | - |
| 16-bit signed halfword | LDRSH | - | LDRSHT | - | - | - | - | - | - | - |
| 8-bit byte | - | STRB | - | STRBT | - | STREXB | LDAB | STLB | LDAEXB | STLEXB |
| 8-bit unsigned byte | LDRB | - | LDRBT | - | LDREXB | - | - | - | - | - |
| 8-bit signed byte | LDRSB | - | LDRSBT | - | - | - | - | - | - | - |
| Two 32-bit words | LDRD | STRD | - | - | - | - | - | - | - | - |
| 64-bit doubleword | - | - | - | - | LDREXD | STREXD | - | - | LDAEXD | STLEXD |

### F1.6.1 Loads to the PC

The LDR instruction can load a value into the PC. The value loaded is treated as an interworking address, as described by the LoadWritePC() pseudocode function in *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

### F1.6.2 Halfword and byte loads and stores

Halfword and byte stores store the least significant halfword or byte from the register, to 16 or 8 bits of memory respectively. There is no distinction between signed and unsigned stores.

Halfword and byte loads load 16 or 8 bits from memory into the least significant halfword or byte of a register. Unsigned loads zero-extend the loaded value to 32 bits, and signed loads sign-extend the value to 32 bits.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F1.6.3 Load unprivileged and Store unprivileged

When executing at EL0, a Load unprivileged or Store unprivileged instruction operates in exactly the same way as the corresponding ordinary load or store instruction. For example, an LDRT instruction executes in exactly the same way as the equivalent LDR instruction. When executed at PL1, Load unprivileged and Store unprivileged instructions behave as they would if they were executed at EL0. For example, an LDRT instruction executes in exactly the way that the equivalent LDR instruction would execute at EL0. In particular, the instructions make unprivileged memory accesses.

**Note**

As described in *Execution privilege, Exception levels, and AArch32 Privilege levels* on page G4-3990, execution at PL1 describes all of the following:

- Execution at Non-secure EL1 using AArch32.
- Execution at Secure EL1 using AArch32 when EL3 is not implemented.
- Execution at Secure EL1 using AArch32 when EL3 is implemented and is using AArch64.
- Execution at Secure EL3 when EL3 is implemented and is using AArch32.

The Load unprivileged and Store unprivileged instructions are UNPREDICTABLE if executed at EL2.

For more information, see *Access permissions* on page G4-4037.

### F1.6.4 Load-Exclusive and Store-Exclusive

Load-Exclusive and Store-Exclusive instructions provide shared memory synchronization. For more information, see *Synchronization and semaphores* on page E2-2395.

### F1.6.5 Load-Acquire and Store-Release

Load-Acquire and Store-Release instructions provide memory barriers. Load-Acquire Exclusive and Store-Release Exclusive instructions provide memory barriers with shared memory synchronization. For more information, see *Load-Acquire, Store-Release* on page E2-2378.

### F1.6.6 Addressing modes

The address for a load or store is formed from two parts: a value from a base register, and an offset.

The base register can be any one of the general-purpose registers R0-R12, SP, or LR.

For loads, the base register can be the PC. This provides PC-relative addressing for position-independent code. Instructions marked (literal) in their title in Chapter F2 *About the T32 and A32 Instruction Descriptions* are PC-relative loads.

The offset takes one of three formats:

**Immediate** The offset is an unsigned number that can be added to or subtracted from the base register value. Immediate offset addressing is useful for accessing data elements that are a fixed distance from the start of the data object, such as structure fields, stack offsets and input/output registers.

**Register** The offset is a value from a general-purpose register. The value can be added to, or subtracted from, the base register value. Register offsets are useful for accessing arrays or blocks of data.

**Scaled register** The offset is a general-purpose register, shifted by an immediate value, then added to or subtracted from the base register. This means an array index can be scaled by the size of each array element.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The offset and base register can be used in three different ways to form the memory address. The addressing modes are described as follows:

**Offset** The offset is added to or subtracted from the base register to form the memory address.

**Pre-indexed** The offset is added to or subtracted from the base register to form the memory address. The base register is then updated with this new address, to permit automatic indexing through an array or memory block.

**Post-indexed** The value of the base register alone is used as the memory address. The offset is then added to or subtracted from the base register. The result is stored back in the base register, to permit automatic indexing through an array or memory block.

**Note**

Not every variant is available for every instruction, and the range of permitted immediate values and the options for scaled registers vary from instruction to instruction. See Chapter F2 *About the T32 and A32 Instruction Descriptions* for full details for each instruction.

## F1.7 Load/store multiple instructions

Load Multiple instructions load from memory a subset, or possibly all, of the general-purpose registers and the PC.

Store Multiple instructions store to memory a subset, or possibly all, of the general-purpose registers.

The memory locations are consecutive word-aligned words. The addresses used are obtained from a base register, and can be either above or below the value in the base register. The base register can optionally be updated by the total size of the data transferred.

Table F1-13 summarizes the load/store multiple instructions in the T32 and A32 instruction sets.

**Table F1-13 Load/store multiple instructions**

| Instruction | See |
|---|---|
| Load Multiple, Increment After or Full Descending | *LDM, LDMIA, LDMFD* on page F6-2711 |
| Load Multiple, Decrement After or Full Ascending [a] | *LDMDA, LDMFA* on page F6-2718 |
| Load Multiple, Decrement Before or Empty Ascending | *LDMDB, LDMEA* on page F6-2720 |
| Load Multiple, Increment Before or Empty Descending [a] | *LDMIB, LDMED* on page F6-2722 |
| Pop multiple registers off the stack [b] | *POP* on page F6-2877 |
| Push multiple registers onto the stack [c] | *PUSH* on page F6-2883 |
| Store Multiple, Increment After or Empty Ascending | *STM, STMIA, STMEA* on page F6-3041 |
| Store Multiple, Decrement After or Empty Descending [a] | *STMDA, STMED* on page F6-3045 |
| Store Multiple, Decrement Before or Full Descending | *STMDB, STMFD* on page F6-3047 |
| Store Multiple, Increment Before or Full Ascending [a] | *STMIB, STMFA* on page F6-3049 |

a. Not available in the T32 instruction set.
b. This instruction is equivalent to an `LDM` instruction with the SP as base register, and base register updating.
c. This instruction is equivalent to an `STMDB` instruction with the SP as base register, and base register updating.

When executing at EL1, variants of the `LDM` and `STM` instructions load and store User mode registers. Another system level variant of the `LDM` instruction performs an exception return.

### F1.7.1 Loads to the PC

The `LDM`, `LDMDA`, `LDMDB`, `LDMIB`, and `POP` instructions can load a value into the PC. The value loaded is treated as an interworking address, as described by the `LoadWritePC()` pseudocode function in *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

## F1.8 Miscellaneous instructions

Table F1-14 summarizes the miscellaneous instructions in the T32 and A32 instruction sets.

**Table F1-14 Miscellaneous instructions**

| Instruction | See |
|---|---|
| Clear-Exclusive | *CLREX* on page F6-2649 |
| Debug Hint | *DBG* on page F6-2669 |
| Data Memory Barrier | *DMB* on page F6-2671 |
| Data Synchronization Barrier | *DSB* on page F6-2673 |
| Instruction Synchronization Barrier | *ISB* on page F6-2688 |
| If-Then | *IT* on page F6-2690 |
| No Operation | *NOP* on page F6-2851 |
| Preload Data | *PLD, PLDW (immediate)* on page F6-2866<br>*PLD (literal)* on page F6-2868<br>*PLD, PLDW (register)* on page F6-2870 |
| Preload Instruction | *PLI (immediate, literal)* on page F6-2872<br>*PLI (register)* on page F6-2875 |
| Set Endianness | *SETEND* on page F6-2962 |
| Send Event | *SEV* on page F6-2963 |
| Send Event Local | *SEVL* on page F6-2965 |
| Wait For Event | *WFE* on page F6-3196 |
| Wait For Interrupt | *WFI* on page F6-3198 |
| Yield | *YIELD* on page F6-3200 |

### F1.8.1 The Yield instruction

In a *Symmetric Multi-Threading* (SMT) design, a thread can use the `YIELD` instruction to give a hint to the PE that it is running on. The `YIELD` hint indicates that whatever the thread is currently doing is of low importance, and so could yield. For example, the thread might be sitting in a spin-lock. A similar use might be in modifying the arbitration priority of the snoop bus in a multiprocessor (MP) system. Defining such an instruction permits binary compatibility between SMT and SMP systems.

AArch32 state defines a `YIELD` instruction as a specific NOP (No Operation) hint instruction.

The `YIELD` instruction has no effect in a single-threaded system, but developers of such systems can use the instruction to flag its intended use on migration to a multiprocessor or multithreading system. Operating systems can use `YIELD` in places where a yield hint is wanted, knowing that it will be treated as a `NOP` if there is no implementation benefit.

## F1.9 Exception-generating and exception-handling instructions

The following instructions are intended specifically to cause a synchronous exception to occur:

- The SVC instruction generates a Supervisor Call exception. For more information, see *Supervisor Call (SVC) exception* on page G1-3815.
- The Breakpoint instruction BKPT provides software breakpoints. For more information, see *Software Breakpoint Instruction exceptions* on page G2-3895.
- In an implementation that includes EL3, when executing at EL1 or higher, the SMC instruction generates a Secure Monitor Call exception. For more information, see *Secure Monitor Call (SMC) exception* on page G1-3816.
- In an implementation that includes EL2, in software executing in a Non-secure EL1 mode, the HVC instruction generates a Hypervisor Call exception. For more information, see *Hypervisor Call (HVC) exception* on page G1-3817.

For an exception taken to an EL1 mode:

- The system level variants of the SUBS and LDM instructions can perform a return from an exception.

  **Note**

  The variants of SUBS include MOVS. See the references to SUBS PC, LR in Table F1-15 for more information.

- The SRS instruction can be used near the start of the handler, to store return information. The RFE instruction can then perform a return from the exception using the stored return information.

In an implementation that includes EL2, the ERET instruction performs a return from an exception taken to Hyp mode.

For more information, see *Exception return to an Exception level using AArch32* on page G1-3796.

Table F1-15 summarizes the instructions, in the T32 and A32 instruction sets, for generating or handling an exception. Except for BKPT and SVC, these are system level instructions.

**Table F1-15 Exception-generating and exception-handling instructions**

| Instruction | See |
|---|---|
| Supervisor Call | *SVC* on page F6-3103 |
| Breakpoint | *BKPT* on page F6-2637 |
| Secure Monitor Call | *SMC* on page F6-2979 |
| Return From Exception | *RFE, RFEDA, RFEDB, RFEIA, RFEIB* on page F6-2915 |
| Subtract (exception return)[a] | *SUB, SUBS (immediate)* on page F6-3088[a] |
| Move (exception return)[a] | *MOV, MOVS (register)* on page F6-2813[a] |
| Hypervisor Call | *HVC* on page F6-2686 |
| Exception Return | *ERET* on page F6-2683 |
| Load Multiple (exception return) | *LDM (exception return)* on page F6-2714 |
| Store Return State | *SRS, SRSDA, SRSDB, SRSIA, SRSIB* on page F6-3013 |

a. The A32 instruction set includes other instruction forms that can be used for an exception return, that have previously been described as variants of SUBS PC, LR. ARM deprecates any use of these instruction forms.

## F1.10 Coprocessor instructions

There are three types of instruction for communicating with conceptual coprocessors. These permit the PE to:

- Initiate a coprocessor data-processing operation. For details see *CDP, CDP2* on page F6-2647.
- Transfer general-purpose registers to and from coprocessor registers. For details, see:
  - *MCR, MCR2* on page F6-2801.
  - *MCRR, MCRR2* on page F6-2803.
  - *MRC, MRC2* on page F6-2825.
  - *MRRC, MRRC2* on page F6-2828.
- Load or store the values of coprocessor registers. For details, see:
  - *LDC, LDC2 (immediate)* on page F6-2704.
  - *LDC, LDC2 (literal)* on page F6-2708.
  - *STC, STC2* on page F6-3026.

The instruction set encodings provide supports up to 16 coprocessors, CP0 to CP15, with a 4-bit field in each coprocessor instruction to identify the coprocessor number. In ARMv8 the only supported coprocessors are CP10, CP11, CP14, and CP15, and these are supported only in AArch32 state.

**Note**

Multiple coprocessors can be used together to provide a larger block of coprocessor instructions. CP10 and CP11 are used in this way.

CP10 and CP11 are used, together, for floating-point and some Advanced SIMD functionality. There are different instructions for accessing these coprocessors, of similar types to the instructions for CP14 and CP15, that is, to:

- Initiate a coprocessor data-processing operation, see *Floating-point data-processing instructions* on page F1-2439.
- Transfer general-purpose registers to and from coprocessor registers, see *Advanced SIMD and floating-point register transfer instructions* on page F1-2430.
- Load or store the values of coprocessor registers, see *Advanced SIMD and floating-point load/store instructions* on page F1-2428.

Coprocessor instructions are part of the instruction stream executed by the PE. Any coprocessor instruction that cannot be executed by the implemented conceptual coprocessors causes an Undefined Instruction exception. This means that, in ARMv8 AArch32 state, all coprocessor access instruction encodings for coprocessors other than CP10, CP11, CP14, and CP15 are unallocated.

## F1.11 Advanced SIMD and floating-point load/store instructions

Table F1-16 summarizes the SIMD and floating-point register file load/store instructions in the Advanced SIMD and floating-point instruction sets.

Advanced SIMD also provides instructions for loading and storing multiple elements, or structures of elements, see *Element and structure load/store instructions*.

**Table F1-16 SIMD and floating-point register file load/store instructions**

| Instruction | See | Operation |
|---|---|---|
| Vector Load Multiple | *VLDM, VLDMDB, VLDMIA* on page F7-3430 | Load 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point.<br>Load 1-16 consecutive 32-bit registers, floating-point only. |
| Vector Load Register | *VLDR* on page F7-3433 | Load one 64-bit register, Advanced SIMD and floating-point.<br>Load one 32-bit register, floating-point only. |
| Vector Store Multiple | *VSTM, VSTMDB, VSTMIA* on page F7-3711 | Store 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point.<br>Store 1-16 consecutive 32-bit registers, floating-point only. |
| Vector Store Register | *VSTR* on page F7-3714 | Store one 64-bit register, Advanced SIMD and floating-point.<br>Store one 32-bit register, floating-point only. |

### F1.11.1 Element and structure load/store instructions

Table F1-17 shows the element and structure load/store instructions available in the Advanced SIMD instruction set. Loading and storing structures of more than one element automatically de-interleaves or interleaves the elements, see Figure F1-1 on page F1-2429 for an example of de-interleaving. Interleaving is the inverse process.

**Table F1-17 Element and structure load/store instructions**

| Instruction | See |
|---|---|
| Load single element | |
| Multiple elements | *VLD1 (multiple single elements)* on page F7-3400 |
| To one lane | *VLD1 (single element to one lane)* on page F7-3394 |
| To all lanes | *VLD1 (single element to all lanes)* on page F7-3397 |
| Load 2-element structure | |
| Multiple structures | *VLD2 (multiple 2-element structures)* on page F7-3409 |
| To one lane | *VLD2 (single 2-element structure to one lane)* on page F7-3403 |
| To all lanes | *VLD2 (single 2-element structure to all lanes)* on page F7-3406 |
| Load 3-element structure | |
| Multiple structures | *VLD3 (multiple 3-element structures)* on page F7-3418 |
| To one lane | *VLD3 (single 3-element structure to one lane)* on page F7-3412 |
| To all lanes | *VLD3 (single 3-element structure to all lanes)* on page F7-3415 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table F1-17 Element and structure load/store instructions (continued)**

| Instruction | See |
|---|---|
| Load 4-element structure | |
| Multiple structures | *VLD4 (multiple 4-element structures)* on page F7-3427 |
| To one lane | *VLD4 (single 4-element structure to one lane)* on page F7-3421 |
| To all lanes | *VLD4 (single 4-element structure to all lanes)* on page F7-3424 |
| Store single element | |
| Multiple elements | *VST1 (multiple single elements)* on page F7-3690 |
| From one lane | *VST1 (single element from one lane)* on page F7-3687 |
| Store 2-element structure | |
| Multiple structures | *VST2 (multiple 2-element structures)* on page F7-3696 |
| From one lane | *VST2 (single 2-element structure from one lane)* on page F7-3693 |
| Store 3-element structure | |
| Multiple structures | *VST3 (multiple 3-element structures)* on page F7-3702 |
| From one lane | *VST3 (single 3-element structure from one lane)* on page F7-3699 |
| Store 4-element structure | |
| Multiple structures | *VST4 (multiple 4-element structures)* on page F7-3708 |
| From one lane | *VST4 (single 4-element structure from one lane)* on page F7-3705 |

Figure F1-1 shows the de-interleaving of a `VLD3.16` (multiple 3-element structures) instruction:

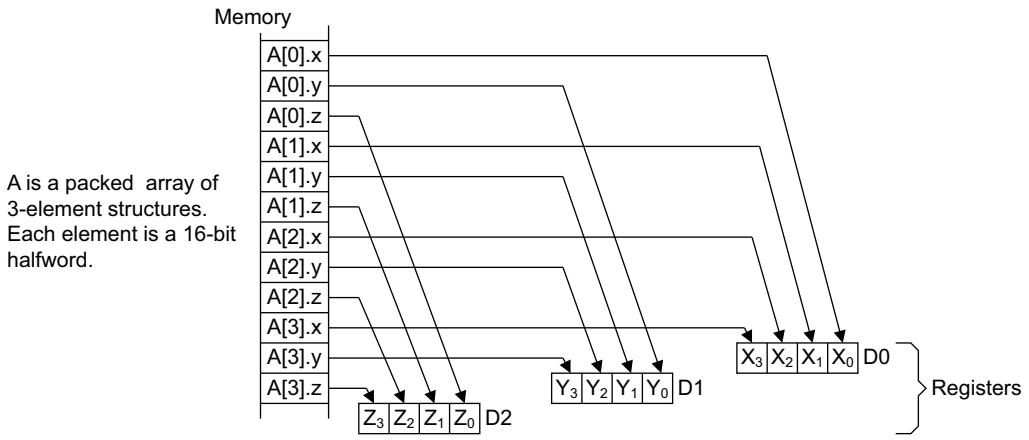

**Figure F1-1 De-interleaving an array of 3-element structures**

Figure F1-1 shows the `VLD3.16` instruction operating to three 64-bit registers that comprise four 16-bit elements:

- Different instructions in this group would produce similar figures, but operate on different numbers of registers. For example, `VLD4` and `VST4` instructions operate on four registers.
- Different element sizes would produce similar figures but with 8-bit or 32-bit elements.
- These instructions operate only on doubleword (64-bit) registers.

Non-Confidential - Beta

## F1.12 Advanced SIMD and floating-point register transfer instructions

Table F1-18 summarizes the SIMD and floating-point register file transfer instructions in the Advanced SIMD and floating-point instruction sets. These instructions transfer data between the general-purpose registers and the registers in the SIMD and floating-point register file.

Advanced SIMD vectors, and single-precision and double-precision floating-point registers, are all views of the same register file. For details see *The SIMD and floating-point register file* on page E1-2325.

**Table F1-18 SIMD and floating-point register file transfer instructions**

| Instruction | See |
|---|---|
| Copy element from general-purpose register to every element of an Advanced SIMD vector | *VDUP (general-purpose register)* on page F7-3370 |
| Copy byte, halfword, or word from general-purpose register to a register in the SIMD and floating-point register file | *VMOV (general-purpose register to scalar)* on page F7-3483 |
| Copy byte, halfword, or word from a register in the SIMD and floating-point register file to a general-purpose register | *VMOV (scalar to general-purpose register)* on page F7-3487 |
| Copy from single-precision floating-point register to general-purpose register, or from general-purpose register to single-precision floating-point register | *VMOV (between general-purpose register and single-precision register)* on page F7-3485 |
| Copy two words from general-purpose registers to consecutive single-precision floating-point registers, or from consecutive single-precision floating-point registers to general-purpose registers | *VMOV (between two general-purpose registers and two single-precision registers)* on page F7-3489 |
| Copy two words from general-purpose registers to a doubleword register in the SIMD and floating-point register file, or from a doubleword register in the SIMD and floating-point register file to general-purpose registers | *VMOV (between two general-purpose registers and a doubleword floating-point register)* on page F7-3474 |
| Copy from an Advanced SIMD and floating-point System Register to a general-purpose register | *VMRS* on page F7-3495 |
| Copy from a general-purpose register to an Advanced SIMD and floating-point System Register | *VMSR* on page F7-3497 |

## F1.13 Advanced SIMD data-processing instructions

Advanced SIMD data-processing instructions process registers containing vectors of elements of the same type packed together, enabling the same operation to be performed on multiple items in parallel.

Instructions operate on vectors held in 64-bit or 128-bit registers. Figure F1-2 shows an operation on two 64-bit operand vectors, generating a 64-bit vector result.

**Note**

Figure F1-2 and other similar figures show 64-bit vectors that consist of four 16-bit elements, and 128-bit vectors that consist of four 32-bit elements. Other element sizes produce similar figures, but with one, two, eight, or sixteen operations performed in parallel instead of four.

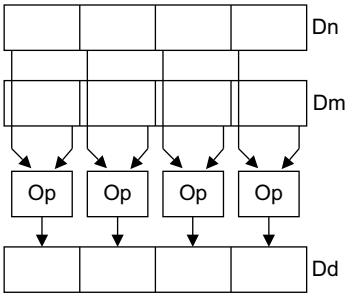

**Figure F1-2 Advanced SIMD instruction operating on 64-bit registers**

Many Advanced SIMD instructions have variants that produce vectors of elements double the size of the inputs. In this case, the number of elements in the result vector is the same as the number of elements in the operand vectors, but each element, and the whole vector, is double the size.

Figure F1-3 shows an example of an Advanced SIMD instruction operating on 64-bit registers, and generating a 128-bit result.

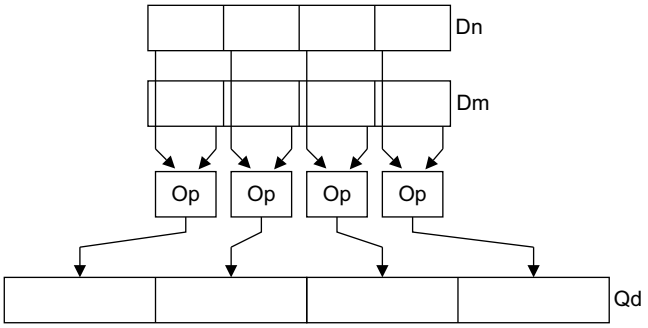

**Figure F1-3 Advanced SIMD instruction producing wider result**

There are also Advanced SIMD instructions that have variants that produce vectors containing elements half the size of the inputs. Figure F1-4 on page F1-2432 shows an example of an Advanced SIMD instruction operating on one 128-bit register, and generating a 64-bit result.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

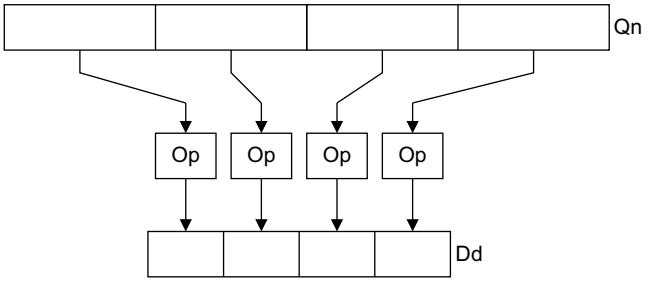

**Figure F1-4 Advanced SIMD instruction producing narrower result**

Some Advanced SIMD instructions do not conform to these standard patterns. Their operation patterns are described in the individual instruction descriptions.

Advanced SIMD instructions that perform floating-point arithmetic use the ARM standard floating-point arithmetic defined in *Floating-point and Advanced SIMD support* on page A1-46.

### F1.13.1 Advanced SIMD parallel addition and subtraction

Table F1-19 shows the Advanced SIMD parallel add and subtract instructions.

**Table F1-19 Advanced SIMD parallel add and subtract instructions**

| Instruction | See |
|---|---|
| Vector Add | *VADD (integer)* on page F7-3265<br>*VADD (floating-point)* on page F7-3262 |

### F1.13.5 Advanced SIMD multiply instructions

Table F1-23 summarizes the Advanced SIMD multiply instructions.

**Table F1-23 Advanced SIMD multiply instructions**

| Instruction | See |
|---|---|
| Vector Multiply Accumulate | *VMLA (integer)* on page F7-3453<br>*VMLA (floating-point)* on page F7-3450<br>*VMLA (by scalar)* on page F7-3455 |
| Vector Multiply Accumulate Long | *VMLAL (integer)* on page F7-3458<br>*VMLAL (by scalar)* on page F7-3460 |
| Vector Multiply Subtract | *VMLS (integer)* on page F7-3465<br>*VMLS (floating-point)* on page F7-3462<br>*VMLS (by scalar)* on page F7-3467 |
| Vector Multiply Subtract Long | *VMLSL (integer)* on page F7-3470<br>*VMLSL (by scalar)* on page F7-3472 |
| Vector Multiply | *VMUL (integer and polynomial)* on page F7-3502<br>*VMUL (floating-point)* on page F7-3499<br>*VMUL (by scalar)* on page F7-3505 |
| Vector Multiply Long | *VMULL (integer and polynomial)* on page F7-3508<br>*VMULL (by scalar)* on page F7-3510 |
| Vector Fused Multiply Accumulate | *VFMA* on page F7-3380 |
| Vector Fused Multiply Subtract | *VFMS* on page F7-3383 |
| Vector Saturating Doubling Multiply Accumulate Long | *VQDMLAL* on page F7-3557 |
| Vector Saturating Doubling Multiply Subtract Long | *VQDMLSL* on page F7-3560 |
| Vector Saturating Doubling Multiply Returning High Half | *VQDMULH* on page F7-3563 |
| Vector Saturating Rounding Doubling Multiply Returning High Half | *VQRDMULH* on page F7-3574 |
| Vector Saturating Doubling Multiply Long | *VQDMULL* on page F7-3566 |

Advanced SIMD multiply instructions can operate on vectors of:

- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit polynomials over {0, 1}. `VMUL` and `VMULL` are the only instructions that operate on polynomials. `VMULL` produces a 16-bit polynomial over {0, 1}.
- Single-precision (32-bit) floating-point numbers.

They can also act on one vector and one scalar.

Long instructions have doubleword (64-bit) operands, and produce quadword (128-bit) results. Other Advanced SIMD multiply instructions can have either doubleword or quadword operands, and produce results of the same size.

Floating-point multiply instructions can operate on:

- Single-precision (32-bit) floating-point numbers.
- Double-precision (64-bit) floating-point numbers.

## F1.14 Floating-point data-processing instructions

Table F1-25 summarizes the data-processing instructions in the floating-point instruction set. In this table, *floating-point register* means a register in the SIMD and floating-point register file.

For details of the floating-point arithmetic used by floating-point instructions, see *Floating-point and Advanced SIMD support* on page A1-46.

**Table F1-25 Floating-point data-processing instructions**

| Instruction | See |
|---|---|
| Convert between double-precision and single-precision | *VCVT (between double-precision and single-precision)* on page F7-3326 |
| Convert between floating-point and fixed-point | *VCVT (between floating-point and fixed-point, floating-point)* on page F7-3340 |
| Convert between half-precision and single-precision, writing to bottom half of single-precision register | *VCVTB* on page F7-3347 |

# Chapter F2
# About the T32 and A32 Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Format of instruction descriptions* on page F2-2442.
- *Standard assembler syntax fields* on page F2-2446.
- *Conditional execution* on page F2-2447.
- *Shifts applied to a register* on page F2-2449.
- *Memory accesses* on page F2-2452.
- *Encoding of lists of general-purpose registers and the PC* on page F2-2453.
- *About the T32 and A32 instruction encodings* on page F2-2454.
- *Additional pseudocode support for instruction descriptions* on page F2-2461.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## F2.1 Format of instruction descriptions

The instruction descriptions in Chapter F6 *T32 and A32 Base Instruction Set Instruction Descriptions* and Chapter F7 *T32 and A32 Advanced SIMD and floating-point Instruction Descriptions* normally use the following format:

- Instruction section title.
- Introduction to the instruction.
- A description of each encoding of the instruction.
- Assembler syntax.
- Pseudocode describing how the instruction operates.
- Notes, if applicable.

Each of these items is described in more detail in the following subsections.

### F2.1.1 Instruction section title

The instruction section title gives the base mnemonic for the instruction or instructions described in the section. When one mnemonic has multiple forms described in separate instruction sections, this is followed by a short description of the form in parentheses. The most common use of this is to distinguish between forms of an instruction in which one of the operands is an immediate value and forms in which it is a register.

### F2.1.2 Introduction to the instruction

The introduction to the instruction briefly describes the main features of the instruction. This description is not necessarily complete and is not definitive. If there is any conflict between it and the more detailed information that follows, the latter takes priority.

### F2.1.3 Instruction encodings

This is a list of one or more instruction encodings. Each instruction encoding is labelled as:

- A1, A2, A3 … for the first, second, third and any additional A32 encodings.
- T1, T2, T3 … for the first, second, third and any additional T32 encodings.

Each instruction encoding description consists of:

- An assembly syntax that ensures that the assembler selects the encoding in preference to any other encoding. In some cases, multiple syntax variants are given. These are written in a `typewriter` font using the conventions described in *Assembler syntax prototype line conventions* on page F2-2444. The correct one to use can be indicated by:
  - A subheading that identifies the encodings that correspond to the syntax. See, for example, the subheading *Flag setting, rotate right with extend variant* in the description of the A1 encoding of the `ADC`, `ADCS` (register) instructions in *A1* on page F6-2579.
  - An annotation to the syntax, such as *Inside IT block* or *Outside IT block*. See, for example, the syntax descriptions of the T1 encoding of the `ADC`, `ADCS` (register) instructions in *T1* on page F6-2580.

  In other cases, the correct one to use can be determined by looking at the assembler syntax description and using it to determine which syntax corresponds to the instruction being disassembled.

  There is usually more than one syntax variant that ensures re-assembly to any particular encoding, and the exact set of syntaxes that do so usually depends on the register numbers, immediate constants and other operands to the instruction. For example, when assembling to the T32 instruction set, the syntax `AND R0, R0, R8` ensures selection of a 32-bit encoding but `AND R0, R0, R1` selects a 16-bit encoding.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For each instruction encoding belonging to a target instruction set, an assembler can use this information to determine whether it can use that encoding to encode the instruction requested by the UAL source. If multiple encodings can encode the instruction then:

— If both a 16-bit encoding and a 32-bit encoding can encode the instruction, the architecture *prefers* the 16-bit encoding. This means the assembler must use the 16-bit encoding rather than the 32-bit encoding.

  Software can use the `.W` and `.N` qualifiers to specify the required encoding width, see *Standard assembler syntax fields* on page F2-2446.

— If multiple encodings of the same length can encode the instruction, the *Assembler syntax* subsection says which encoding is preferred, and how software can, instead, select the other encodings.

  Each encoding also documents UAL syntax that selects it in preference to any other encoding.

If no encodings of the target instruction set can encode the instruction requested by the UAL source, normally the assembler generates an error saying that the instruction is not available in that instruction set.

**Note**

In some cases, an instruction is available in one instruction set but not in another. The *Assembler syntax* subsection identifies many of these cases. For example, the A32 instructions with bits<31:28> == `0b1111` described in *Branch, branch with link, and block data transfer* on page F4-2535, *Coprocessor instructions, and Supervisor Call* on page F4-2537, and *Unconditional instructions* on page F4-2541 cannot have a condition code, but the equivalent T32 instructions often can, and this usually appears in the *Assembler syntax* subsection as a statement that the A32 instruction cannot be conditional.

However, some such cases are too complex to describe in the available space, so the definitive test of whether an instruction is available in a given instruction set is whether there is an available encoding for it in that instruction set.

The assembly syntax given for an encoding is therefore a suitable one for a disassembler to disassemble that encoding to. However, disassemblers might wish to use simpler syntaxes when they are suitable for the operand combination, in order to produce more readable disassembled code.

- An encoding diagram. This is half-width for 16-bit T32 encodings and full-width for 32-bit T32 and A32 encodings. The 32-bit A32 encoding diagrams number the bits from 31 to 0, while the 32-bit T32 encoding diagrams number the bits from 15 to 0 for each halfword, to distinguish them from A32 encodings and to act as a reminder that a 32-bit T32 instruction consists of two consecutive halfwords rather than a word.

  In particular, if instructions are stored using the standard little-endian instruction endianness, the encoding diagram for an A32 instruction at address A shows the bytes at addresses A+3, A+2, A+1, A from left to right, but the encoding diagram for a 32-bit T32 instruction shows them in the order A+1, A for the first halfword, followed by A+3, A+2 for the second halfword.

- Encoding-specific pseudocode. This is pseudocode that translates the encoding-specific instruction fields into inputs to the encoding-independent pseudocode in the *Operation* subsection, and that picks out any special cases in the encoding. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see Appendix K11 *ARM Pseudocode Definition*.

### F2.1.4 Assembler symbols

The *Assembly symbols* describes the standard UAL syntax for the instruction.

Each syntax description consists of the following elements:

- Descriptions of all of the variable or optional fields of the syntax.

  Some syntax fields are standardized across all or most instructions. *Standard assembler syntax fields* on page F2-2446 describes these fields.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

By default, syntax fields that specify registers, such as <Rd>, <Rn>, or <Rt>, can be any of R0-R12 or LR in T32 instructions, and any of R0-R12, SP or LR in A32 instructions. These require that the encoding-specific pseudocode set the corresponding integer variable (such as d, n, or t) to the corresponding register number, using 0-12 for R0-R12, 13 for SP, or 14 for LR:

— Normally, software can do this by setting the corresponding field in the instruction, typically named Rd, Rn, Rt, to the binary encoding of that number.

— In the case of 16-bit T32 encodings, the field is normally of length 3, and so the encoding is only available when the assembler syntax specifies one of R0-R7. Such encodings often use a register field name like Rdn. This indicates that the encoding is only available if <Rd> and <Rn> specify the same register, and that the register number of that register is encoded in the field if they do.

The description of a syntax field that specifies a register sometimes extends or restricts the permitted range of registers or documents other differences from the default rules for such fields. Examples of extensions are permitting the use of the SP in a T32 instruction, or permitting the use of the PC, identified using register number 15.

- Where appropriate, text that briefly describes changes from the pre-UAL assembler syntax. Where present, this usually consists of an alternative pre-UAL form of the assembler mnemonic. The pre-UAL assembler syntax does not conflict with UAL. ARM recommends that it is supported, as an optional extension to UAL, so that pre-UAL assembler source files can be assembled.

### Assembler syntax prototype line conventions

The following conventions are used in assembler syntax prototype lines and their subfields:

**< >** Any item bracketed by < and > is a short description of a type of value to be supplied by the user in that position. A longer description of the item is normally supplied by subsequent text. Such items often correspond to a similarly named field in an encoding diagram for an instruction. When the correspondence only requires the binary encoding of an integer value or register number to be substituted into the instruction encoding, it is not described explicitly. For example, if the assembler syntax for an instruction contains an item <Rn> and the instruction encoding diagram contains a 4-bit field named Rn, the number of the register specified in the assembler syntax is encoded in binary in the instruction field.

If the correspondence between the assembler syntax item and the instruction encoding is more complex than simple binary encoding of an integer or register number, the item description indicates how it is encoded. This is often done by specifying a required output from the encoding-specific pseudocode, such as add = TRUE. The assembler must only use encodings that produce that output.

**{ }** Any item bracketed by { and } is optional. A description of the item and of how its presence or absence is encoded in the instruction is normally supplied by subsequent text.

Many instructions have an optional destination register. Unless otherwise stated, if such a destination register is omitted, it is the same as the immediately following source register in the instruction syntax.

**#** In the assembler syntax, numeric constants are normally preceded by a #. Some UAL instruction syntax descriptions explicitly show this # as optional. Any UAL assembler:

- Must treat the # as optional where an instruction syntax description shows it as optional.
- Can treat the # either as mandatory or as optional where an instruction syntax description does not show it as optional.

**Note**

ARM recommends that UAL assemblers treat all uses of # shown in this manual as optional.

**spaces** Single spaces are used for clarity, to separate items. When a space is obligatory in the assembler syntax, two or more consecutive spaces are used.

**+/-** This indicates an optional + or - sign. If neither is coded, + is assumed.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

All other characters must be encoded precisely as they appear in the assembler syntax. Apart from { and }, the special characters described above do not appear in the basic forms of assembler instructions documented in this manual. In a few places, the { and } characters must be encoded as part of a variable item. When this happens, the long description of the variable item indicates how they must be used.

### F2.1.5 Pseudocode describing how the instruction operates

The *Operation for all classes* subsection contains encoding-independent pseudocode that describes the main operation of the instruction. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see Appendix K11 *ARM Pseudocode Definition*.

Non-Confidential - Beta

## F2.2 Standard assembler syntax fields

The following assembler syntax fields are standard across all or most instructions:

<c> Is an optional field. It specifies the condition under which the instruction is executed. See *Conditional execution* on page F2-2447 for the range of available conditions and their encoding. If <c> is omitted, it defaults to *always* (AL).

<q> Specifies optional assembler qualifiers on the instruction. The following qualifiers are defined:

- .N Meaning narrow, specifies that the assembler must select a 16-bit encoding for the instruction. If this is not possible, an assembler error is produced.
- .W Meaning wide, specifies that the assembler must select a 32-bit encoding for the instruction. If this is not possible, an assembler error is produced.

If neither .W nor .N is specified, the assembler can select either 16-bit or 32-bit encodings. If both are available, it must select a 16-bit encoding. In a few cases, more than one encoding of the same length can be available for an instruction. The rules for selecting between such encodings are instruction-specific and are part of the instruction description. The assembler syntax includes a mandatory .W qualifier, along with a note describing the cases in which it applies, where this qualifier is required to select a particular encoding for an instruction. Additional assembler syntax will describe the syntax when the conditions are not met.

**Note**

When assembling to the A32 instruction set, the .N qualifier produces an assembler error and the .W qualifier has no effect.

## F2.3 Conditional execution

Most T32 and A32 instructions can be executed conditionally, based on the values of the APSR condition flags. Table F2-1 lists the available conditions.

**Table F2-1 Condition codes**

| cond | Mnemonic extension | Meaning (integer) | Meaning (floating-point) [a] | Condition flags |
|---|---|---|---|---|
| 0000 | EQ | Equal | Equal | Z == 1 |
| 0001 | NE | Not equal | Not equal, or unordered | Z == 0 |
| 0010 | CS [b] | Carry set | Greater than, equal, or unordered | C == 1 |
| 0011 | CC [c] | Carry clear | Less than | C == 0 |
| 0100 | MI | Minus, negative | Less than | N == 1 |
| 0101 | PL | Plus, positive or zero | Greater than, equal, or unordered | N == 0 |
| 0110 | VS | Overflow | Unordered | V == 1 |
| 0111 | VC | No overflow | Not unordered | V == 0 |
| 1000 | HI | Unsigned higher | Greater than, or unordered | C == 1 and Z == 0 |
| 1001 | LS | Unsigned lower or same | Less than or equal | C == 0 or Z == 1 |
| 1010 | GE | Signed greater than or equal | Greater than or equal | N == V |
| 1011 | LT | Signed less than | Less than, or unordered | N != V |
| 1100 | GT | Signed greater than | Greater than | Z == 0 and N == V |
| 1101 | LE | Signed less than or equal | Less than, equal, or unordered | Z == 1 or N != V |
| 1110 | None (AL) [d] | Always (unconditional) | Always (unconditional) | Any |

a. Unordered means at least one NaN operand.
b. HS (unsigned higher or same) is a synonym for CS.
c. LO (unsigned lower) is a synonym for CC.
d. AL is an optional mnemonic extension for always, except in IT instructions. For details see *IT* on page F6-2690.

In T32 instructions, the condition, if it is not AL, is normally encoded in a preceding IT instruction. For more information see *Conditional instructions* on page F1-2409 and *IT* on page F6-2690. Some conditional branch instructions do not require a preceding IT instruction, because they include a condition code in their encoding.

In A32 instructions, bits[31:28] of the instruction contain either:

- The condition code, see *The condition code field in A32 instruction encodings* on page F2-2448.
- 0b1111 for some A32 instructions that can only be executed unconditionally.

ARM deprecates the conditional execution of any instruction encoding provided by Advanced SIMD that is not also provided by floating-point, and strongly recommends that:

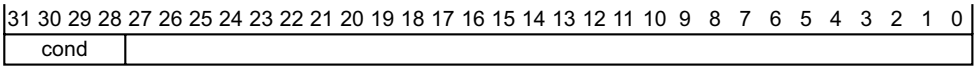
- For A32 instructions, any such Advanced SIMD instruction that can be conditionally executed is executed with the <c> field omitted or set to AL.

  **Note**

  This applies only to VDUP, see *VDUP (general-purpose register)* on page F7-3370. The other A32 instructions do not permit conditional execution.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- For T32 instructions, such Advanced SIMD instructions are never included in an IT block. This means they must be specified with the <c> field omitted or set to AL.



This deprecation does not apply to Advanced SIMD instruction encodings that are also available as floating-point instruction encodings. That is, it does not apply to the Advanced SIMD encodings of the instructions described in the following sections:

- *VLDM, VLDMDB, VLDMIA* on page F7-3430.
- *VLDR* on page F7-3433.
- *VMOV (general-purpose register to scalar)* on page F7-3483.
- *VMOV (between two general-purpose registers and a doubleword floating-point register)* on page F7-3474.
- *VMRS* on page F7-3495.
- *VMSR* on page F7-3497.
- *VPOP* on page F7-3549.
- *VPUSH* on page F7-3551.
- *VSTM, VSTMDB, VSTMIA* on page F7-3711.
- *VSTR* on page F7-3714.

See also *Conditional execution of undefined instructions* on page G1-3813.

### F2.3.1 The condition code field in A32 instruction encodings

Every conditional A32 instruction contains a 4-bit condition code field, the cond field, in bits 31 to 28:

This field contains one of the values 0b0000-0b1110, as shown in Table F2-1 on page F2-2447. Most instruction mnemonics can be extended with the letters defined in the *Mnemonic extension* on page F2-2447 column of that table.

If the *always* (AL) condition is specified, the instruction is executed irrespective of the value of the condition flags. The absence of a condition code on an instruction mnemonic implies the AL condition code.

### F2.3.2 Pseudocode description of conditional execution

The AArch32.CurrentCond() function returns a 4-bit condition specifier as follows:

- For A32 instructions, it returns bits[31:28] of the instruction.
- For the T1 and T3 encodings of the Branch instruction (see *B* on page F6-2623), it returns the 4-bit cond field of the encoding.
- For all other T32 instructions:
  - If PSTATE.IT<3:0> != '0000' it returns PSTATE.IT<7:4>.
  - If PSTATE.IT<7:0> == '00000000' it returns '1110'.
  - Otherwise, execution of the instruction is UNPREDICTABLE.

  For more information, see *Process state, PSTATE* on page E1-2319.

The ConditionPassed() function uses this condition specifier and the condition flags to determine whether the instruction must be executed, by calling the ConditionHolds() function.

Chapter J1 *ARMv8 Pseudocode* includes the definitions of these functions.

*Undefined Instruction exception* on page G1-3811 describes the handling of conditional instructions that are UNDEFINED or UNPREDICTABLE. The pseudocode in the manual, as a sequential description of the instructions, has limitations in this respect. For more information, see *Limitations of the instruction pseudocode* on page K11-5650.

## F2.4 Shifts applied to a register

A32 register offset load/store word and unsigned byte instructions can apply a wide range of different constant shifts to the offset register. Both T32 and A32 data-processing instructions can apply the same range of different constant shifts to the second operand register. For details see *Constant shifts*.

A32 data-processing instructions can apply a register-controlled shift to the second operand register.

### F2.4.1 Constant shifts

These are the same in T32 and A32 instructions, except that the input bits come from different positions.

`<shift>` is an optional shift to be applied to `<Rm>`. It can be any one of:

**(omitted)** No shift.

`LSL #<n>` Logical shift left `<n>` bits. 1 <= `<n>` <= 31.

`LSR #<n>` Logical shift right `<n>` bits. 1 <= `<n>` <= 32.

`ASR #<n>` Arithmetic shift right `<n>` bits. 1 <= `<n>` <= 32.

`ROR #<n>` Rotate right `<n>` bits. 1 <= `<n>` <= 31.

`RRX` Rotate right one bit, with extend. Bit[0] is written to `shifter_carry_out`, bits[31:1] are shifted right one bit, and the Carry flag is shifted into bit[31].

**Note**

Assemblers can permit the use of some or all of `ASR #0`, `LSL #0`, `LSR #0`, and `ROR #0` to specify that no shift is to be performed. This is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must omit the shift specifier when the instruction specifies no shift.

Similarly, assemblers can permit the use of `#0` in the immediate forms of `ASR`, `LSL`, `LSR`, and `ROR` instructions to specify that no shift is to be performed, that is, that a `MOV` (register) instruction is wanted. Again, this is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must use the `MOV` (register) syntax when the instruction specifies no shift.

#### Encoding

The assembler encodes `<shift>` into two type bits and five immediate bits, as follows:

**(omitted)** type = `0b00`, immediate = 0.

`LSL #<n>` type = `0b00`, immediate = `<n>`.

`LSR #<n>` type = `0b01`.
If `<n>` < 32, immediate = `<n>`.
If `<n>` == 32, immediate = 0.

`ASR #<n>` type = `0b10`.
If `<n>` < 32, immediate = `<n>`.
If `<n>` == 32, immediate = 0.

`ROR #<n>` type = `0b11`, immediate = `<n>`.

`RRX` type = `0b11`, immediate = 0.

Non-Confidential - Beta

### F2.4.2 Register controlled shifts

These are only available in A32 instructions.

<type> is the type of shift to apply to the value read from <Rm>. It must be one of:

| | |
|---|---|
| ASR | Arithmetic shift right, encoded as type = 0b10. |
| LSL | Logical shift left, encoded as type = 0b00. |
| LSR | Logical shift right, encoded as type = 0b01. |
| ROR | Rotate right, encoded as type = 0b11. |

The bottom byte of <Rs> contains the shift amount.

### F2.4.3 Pseudocode description of instruction-specified shifts and rotates

```
enumeration SRType {SRType_LSL, SRType_LSR, SRType_ASR, SRType_ROR, SRType_RRX};

// DecodeImmShift()
// ================

(SRType, integer) DecodeImmShift(bits(2) type, bits(5) imm5)

    case type of
        when '00'
            shift_t = SRType_LSL;  shift_n = UInt(imm5);
        when '01'
            shift_t = SRType_LSR;  shift_n = if imm5 == '00000' then 32 else UInt(imm5);
        when '10'
            shift_t = SRType_ASR;  shift_n = if imm5 == '00000' then 32 else UInt(imm5);
        when '11'
            if imm5 == '00000' then
                shift_t = SRType_RRX;  shift_n = 1;
            else
                shift_t = SRType_ROR;  shift_n = UInt(imm5);

    return (shift_t, shift_n);

// DecodeRegShift()
// ================

SRType DecodeRegShift(bits(2) type)
    case type of
        when '00'  shift_t = SRType_LSL;
        when '01'  shift_t = SRType_LSR;
        when '10'  shift_t = SRType_ASR;
        when '11'  shift_t = SRType_ROR;
    return shift_t;

// Shift()
// =======

bits(N) Shift(bits(N) value, SRType type, integer amount, bit carry_in)
    (result, -) = Shift_C(value, type, amount, carry_in);
    return result;

// Shift_C()
// =========

(bits(N), bit) Shift_C(bits(N) value, SRType type, integer amount, bit carry_in)
    assert !(type == SRType_RRX && amount != 1);

    if amount == 0 then
        (result, carry_out) = (value, carry_in);
    else
        case type of
            when SRType_LSL
                (result, carry_out) = LSL_C(value, amount);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
        when SRType_LSR
            (result, carry_out) = LSR_C(value, amount);
        when SRType_ASR
            (result, carry_out) = ASR_C(value, amount);
        when SRType_ROR
            (result, carry_out) = ROR_C(value, amount);
        when SRType_RRX
            (result, carry_out) = RRX_C(value, carry_in);

return (result, carry_out);
```

## F2.5 Memory accesses

Commonly, the following addressing modes are permitted for memory access instructions:

**Offset addressing**

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access. The value of the base register is unchanged.

The assembly language syntax for this mode is:

`[<Rn>, <offset>]`

**Pre-indexed addressing**

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access, and written back into the base register.

The assembly language syntax for this mode is:

`[<Rn>, <offset>]!`

**Post-indexed addressing**

The address obtained from the base register is used, unchanged, as the address for the memory access. The offset value is applied to the address, and written back into the base register

The assembly language syntax for this mode is:

`[<Rn>], <offset>`

In each case, `<Rn>` is the base register. `<offset>` can be:

- An immediate constant, such as `<imm8>` or `<imm12>`.
- An index register, `<Rm>`.
- A shifted index register, such as `<Rm>, LSL #<shift>`.

For information about unaligned access, endianness, and exclusive access, see:

- *Alignment support* on page E2-2363.
- *Endian support* on page E2-2365.
- *Synchronization and semaphores* on page E2-2395.

## F2.6 Encoding of lists of general-purpose registers and the PC

A number of instructions operate on lists of general-purpose registers. For some load instructions, the list of registers to be loaded can include the PC. For these instructions, the assembler syntax includes a `<registers>` field, that provides a list of the registers to be operated on, with list entries separated by commas.

The registers list is encoded in the instruction encoding. Most often, this is done using an 8-bit, 13-bit, or 16-bit `register_list` field. This section gives more information about these and other possible register list encodings.

In a `register_list` field, each bit corresponds to a single register, and if the `<registers>` field of the assembler instruction includes Rt then `register_list<t>` is set to 1, otherwise it is set to 0.

The full rules for the encoding of lists of general-purpose registers, and possibly the PC, are:

- Except for the cases listed here, 16-bit T32 encodings use an 8-bit register list, and can access only registers R0-R7.

  The exceptions to this rule are:

  — The T1 encoding of `POP` uses an 8-bit register list, and an additional bit, `P`, that corresponds to the PC. This means it can access any of R0-R7 and the PC.

  — The T1 encoding of `PUSH` uses an 8-bit register list, and an additional bit, `M`, that corresponds to the LR. This means it can access any of R0-R7 and the LR.

- 32-bit T32 encodings of load operations use a 13-bit register list, and two additional bits, `M`, corresponding to the LR, and `P`, corresponding to the PC. This means these instructions can access any of R0-R12 and the LR and PC.

- 32-bit T32 encodings of store operations use a 13-bit register list, and one additional bit, `M`, corresponding to the LR. This means these instructions can access any of R0-R12 and the LR.

- Except for the case listed here, A32 encodings use a 16-bit register list. This means these instructions can access any of R0-R12 and the SP, LR, and PC.

  The exception to this rule is:

  — The system instructions `LDM` (exception return) and `LDM` (User registers) use a 15-bit register list. This means these instructions can access any of R0-R12 and the SP and LR.

- The T3 and A2 encodings of `POP`, and the T3 and A2 encodings of `PUSH`, access a single register from the set of registers {R0-R12, LR, PC} and encode the register number in the `Rt` field.

**Note**

`POP` is a load operation, and `PUSH` is a store operation.

In every case, the encoding-specific pseudocode converts the register list into a 32-bit variable, `registers`, with a bit corresponding to each of the registers R0-R12, SP, LR, and PC.

**Note**

Some floating-point and Advanced SIMD instructions operate on lists of SIMD and floating-point registers. The assembler syntax of these instructions includes a `<list>` field that specifies the registers to be operated on, and the description of the instruction in *Alphabetical list of T32 and A32 base instruction set instructions* on page F6-2576 defines the use and encoding of this field.

## F2.7 About the T32 and A32 instruction encodings

Chapter F3 *T32 Base Instruction Set Encoding* describes the T32 instruction encodings, and Chapter F4 *A32 Base Instruction Set Encoding* describes the A32 instruction encodings. The following subsections give more information about these encodings:

- *UNDEFINED and UNPREDICTABLE instruction set space*.
- *The PC and the use of 0b1111 as a register specifier* on page F2-2455.
- *The SP and the use of 0b1101 as a register specifier* on page F2-2456.
- *Modified immediate constants in A32 instructions* on page F2-2456.
- *Modified immediate constants in T32 instructions* on page F2-2459.

### F2.7.1 UNDEFINED and UNPREDICTABLE instruction set space

An attempt to execute an unallocated instruction results in either:

- Unpredictable behavior. The instruction is described as UNPREDICTABLE.

  ARMv8-A greatly reduces the architecturally UNPREDICTABLE behavior in AArch32 state. Many cases that earlier versions of the architecture describe as unpredictable become either:

  — CONSTRAINED UNPREDICTABLE, meaning the architecture defines a limited range of permitted behaviors.

  — Fully predictable.

  For more information see Appendix K1 *Architectural Constraints on UNPREDICTABLE behaviors*.

  The AArch32 parts of this manual might sometimes describe as UNPREDICTABLE behavior that ARMv8-A makes CONSTRAINED UNPREDICTABLE.

- An Undefined Instruction exception. The instruction is described as UNDEFINED.

An instruction is UNDEFINED if it is declared as UNDEFINED in an instruction description, or in Chapter F3 *T32 Base Instruction Set Encoding* or Chapter F4 *A32 Base Instruction Set Encoding*.

An instruction is UNPREDICTABLE if:

- It is declared as UNPREDICTABLE in an instruction description or in Chapter F3 or Chapter F4, and Appendix K1 does not redefine the behavior as CONSTRAINED UNPREDICTABLE.
- The pseudocode for that encoding does not indicate that a different special case applies, and a bit marked (0) or (1) in the encoding diagram of an instruction is not 0 or 1 respectively. In most cases, ARMv8 makes these cases CONSTRAINED UNPREDICTABLE, as described in *SBZ or SBO fields in instructions* on page K1-5426.

Unless otherwise specified, T32 and A32 instructions provided as part of an architectural extension, or by an optional feature of the architecture, are UNDEFINED in an implementation that does not include that extension or feature.

**Note**

Examples of where this rule applies are:

- The instructions provided by the Cryptographic Extension.
- The system instructions that provide access to the System registers of the OPTIONAL Performance Monitors Extension.
- The Advanced SIMD and floating-point instructions.

For more information about UNDEFINED and UNPREDICTABLE instruction behavior, see *Undefined Instruction exception* on page G1-3811.

For more information about the behavior of T32 and A32 instructions in earlier versions of the architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

### F2.7.2 The PC and the use of 0b1111 as a register specifier

Restrictions on the use of PC or 0b1111 as a register specifier differ between the T32 and the A32 instruction sets, as described in:

- *T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier*.
- *A32 restrictions on the use of PC or 0b1111 as a register specifier* on page F2-2456.

#### T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier

The use of 0b1111 as a register specifier is not normally permitted in T32 instructions. When a value of 0b1111 is permitted, a variety of meanings is possible. For register reads, these meanings include:

- Read the PC value, that is, the address of the current instruction + 4. The base register of the table branch instructions TBB and TBH can be the PC. This means branch tables can be placed in memory immediately after the instruction.

  **Note**

  ARM deprecates use of the PC as the base register in the STC instruction.

- Read the word-aligned PC value, that is, the address of the current instruction + 4, with bits[1:0] forced to zero. The base register of LDC, LDR, LDRB, LDRD (pre-indexed, no writeback), LDRH, LDRSB, and LDRSH instructions can be the word-aligned PC. This provides PC-relative data addressing. In addition, some encodings of the ADD and SUB instructions permit their source registers to be 0b1111 for the same purpose.

- Read zero. This is done in some cases when one instruction is a special case of another, more general instruction, but with one operand zero. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.

For register writes, these meanings include:

- The PC can be specified as the destination register of an LDR instruction. This is done by encoding Rt as 0b1111. The loaded value is treated as an address, and the effect of execution is a branch to that address. Bit[0] of the loaded value selects whether to execute A32 or T32 instructions after the branch.

- Some other instructions write the PC in similar ways. An instruction can specify that the PC is written:
  - Implicitly, for example, branch instructions.
  - Explicitly by a register specifier of 0b1111, for example 16-bit MOV (register) instructions.
  - Explicitly by using a register mask, for example LDM instructions.

  The address to branch to can be:
  - A loaded value, for example, RFE.
  - A register value, for example, BX.
  - The result of a calculation, for example, TBB or TBH.

  The method of choosing the instruction set used after the branch can be:
  - Similar to the LDR case, for example, LDM or BX.
  - A fixed instruction set other than the one currently being used, for example, the immediate form of BLX.
  - Unchanged, for example, branch instructions or 16-bit MOV (register) instructions.
  - Set from the SPSR.T bit, for RFE and SUBS PC, LR, #imm8.

- Discard the result of a calculation. This is done in some cases when one instruction is a special case of another, more general instruction, but with the result discarded. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.

- If the destination register specifier of an LDRB, LDRH, LDRSB, or LDRSH instruction is 0b1111, the instruction is a memory hint instead of a load operation.

- If the destination register specifier of an MRC instruction is 0b1111, bits[31:28] of the value transferred from the coprocessor are written to the N, Z, C, and V condition flags in the APSR, and bits[27:0] are discarded.

Non-Confidential - Beta

### A32 restrictions on the use of PC or 0b1111 as a register specifier

In A32 instructions, the use of 0b1111 as a register specifier specifies the PC.

Many instructions are UNPREDICTABLE if they use 0b1111 as a register specifier. This is specified by pseudocode in the instruction description. ARMv8-A constrains the resulting UNPREDICTABLE behavior, see *Using R15* on page K1-5423.

**Note**

ARM deprecates use of the PC as the base register in any store instruction.

## F2.7.3 The SP and the use of 0b1101 as a register specifier

In the T32 and A32 instruction sets, ARM strongly recommends that the use of 0b1101 as a register specifier specifies the SP, and deprecates using SP (R13) for any purpose other than as a stack pointer.

**Note**

- The recommendation that register specifier 0b1101 is used only to specify the SP applies to both the T32 and the A32 instruction sets.
- Despite this recommendation, in ARMv8, most T32 uses of R13 as a general-purpose register behave predictably. This differs from ARMv7, where many uses of R13 are UNPREDICTABLE. For more information, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

## F2.7.4 Modified immediate constants in A32 instructions

The encoding of a modified immediate constant in an A32 instruction is:

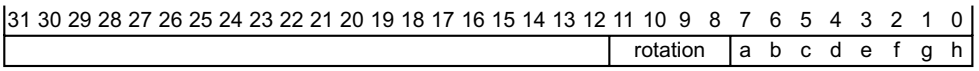

Table F2-2 shows the range of modified immediate constants available in A32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, and h bits and the rotation field in the instruction.

**Table F2-2 Encoding of modified immediates in A32 processing instructions**

| rotation | <const> [a] |
|---|---|
| 0000 | 00000000 00000000 00000000 abcdefgh |
| 0001 | gh000000 00000000 00000000 00abcdef |
| 0010 | efgh0000 00000000 00000000 0000abcd |
| 0011 | cdefgh00 00000000 00000000 000000ab |
| 0100 | abcdefgh 00000000 00000000 00000000 |
| . | . |
| . | . 8-bit values shifted to other even-numbered positions |
| . | . |
| 1001 | 00000000 00abcdef gh000000 00000000 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**Table F2-2 Encoding of modified immediates in A32 processing instructions (continued)**

| rotation | <const> [a] |
|---|---|
| . | . |
| . | . 8-bit values shifted to other even-numbered positions |
| . | . |
| 1110 | 00000000 00000000 0000abcd efgh0000 |
| 1111 | 00000000 00000000 000000ab cdefgh00 |

a. This table shows the immediate constant value in binary form, to relate abcdefgh to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).

**Note**

The range of values available in A32 modified immediate constants is slightly different from the range of values available in 32-bit T32 instructions. See *Modified immediate constants in T32 instructions* on page F2-2459.

### Carry out

A logical instruction with the rotation field set to `0b0000` does not affect APSR.C. Otherwise, a logical flag-setting instruction sets APSR.C to the value of bit[31] of the modified immediate constant.

### Constants with multiple encodings

Some constant values have multiple possible encodings. In this case, a UAL assembler must select the encoding with the lowest unsigned value of the rotation field. This is the encoding that appears first in Table F2-2 on page F2-2456. For example, the constant `#3` must be encoded with (rotation, abcdefgh) == (`0b0000`, `0b00000011`), not (`0b0001`, `0b00001100`), (`0b0010`, `0b00110000`), or (`0b0011`, `0b11000000`).

In particular, this means that all constants in the range 0-255 are encoded with rotation == `0b0000`, and permitted constants outside that range are encoded with rotation != `0b0000`. A flag-setting logical instruction with a modified immediate constant therefore leaves APSR.C unchanged if the constant is in the range 0-255 and sets it to the most significant bit of the constant otherwise. This matches the behavior of T32 modified immediate constants for all constants that are permitted in both the A32 and T32 instruction sets.

An alternative syntax is available for a modified immediate constant that permits the programmer to specify the encoding directly. In this syntax, `#<const>` is instead written as `#<byte>, #<rot>`, where:

`<byte>` Is the numeric value of abcdefgh, in the range 0-255.

`<rot>` Is twice the numeric value of rotation, an even number in the range 0-30.

This syntax permits all A32 data-processing instructions with modified immediate constants to be disassembled to assembler syntax that assembles to the original instruction.

This syntax also makes it possible to write variants of some flag-setting logical instructions that have different effects on APSR.C to those obtained with the normal `#<const>` syntax. For example, `ANDS R1, R2, #12, #2` has the same behavior as `ANDS R1, R2, #3` except that it sets APSR.C to 0 instead of leaving it unchanged. Such variants of flag-setting logical instructions do not have equivalents in the T32 instruction set, and ARM deprecates their use.

### Operation of modified immediate constants, A32 instructions

```
// A32ExpandImm()
// ==============

bits(32) A32ExpandImm(bits(12) imm12)

    // PSTATE.C argument to following function call does not affect the imm32 result.
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    (imm32, -) = A32ExpandImm_C(imm12, PSTATE.C);

    return imm32;

// A32ExpandImm_C()
// ================

(bits(32), bit) A32ExpandImm_C(bits(12) imm12, bit carry_in)

    unrotated_value = ZeroExtend(imm12<7:0>, 32);
    (imm32, carry_out) = Shift_C(unrotated_value, SRType_ROR, 2*UInt(imm12<11:8>), carry_in);

    return (imm32, carry_out);
```

### F2.7.5 Modified immediate constants in T32 instructions

The encoding of a modified immediate constant in a 32-bit T32 instruction is:

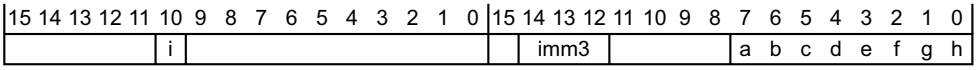

Table F2-3 shows the range of modified immediate constants available in T32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, h, and i bits, and the imm3 field, in the instruction.

**Table F2-3 Encoding of modified immediates in T32 data-processing instructions**

| i:imm3:a | <const> [a] |
|---|---|
| 0000x | `00000000 00000000 00000000 abcdefgh` |
| 0001x | `00000000 abcdefgh 00000000 abcdefgh` [b] |
| 0010x | `abcdefgh 00000000 abcdefgh 00000000` [b] |
| 0011x | `abcdefgh abcdefgh abcdefgh abcdefgh` [b] |
| 01000 | `1bcdefgh 00000000 00000000 00000000` |
| 01001 | `01bcdefg h0000000 00000000 00000000` [c] |
| 01010 | `001bcdef gh000000 00000000 00000000` |
| 01011 | `0001bcde fgh00000 00000000 00000000` [c] |
| . . . | . . . 8-bit values shifted to other positions |
| 11101 | `00000000 00000000 000001bc defgh000` [c] |
| 11110 | `00000000 00000000 0000001b cdefgh00` |
| 11111 | `00000000 00000000 00000001 bcdefgh0` [c] |

a. This table shows the immediate constant value in binary form, to relate `abcdefgh` to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).
b. ARM deprecates using a modified immediate with abcdefgh == 00000000.
c. Not available in A32 instructions if `h` == 1.

**Note**

As the footnotes to Table F2-3 show, the range of values available in T32 modified immediate constants is slightly different from the range of values available in A32 instructions. See *Modified immediate constants in A32 instructions* on page F2-2456 for the A32 values.

#### Carry out

A logical instruction with i:imm3:a == '00xxx' does not affect the Carry flag. Otherwise, a logical flag-setting instruction sets the Carry flag to the value of bit[31] of the modified immediate constant.

### Operation of modified immediate constants, T32 instructions

```
// T32ExpandImm()
// ==============

bits(32) T32ExpandImm(bits(12) imm12)

    // PSTATE.C argument to following function call does not affect the imm32 result.
    (imm32, -) = T32ExpandImm_C(imm12, PSTATE.C);

    return imm32;

// T32ExpandImm_C()
// ================

(bits(32), bit) T32ExpandImm_C(bits(12) imm12, bit carry_in)

    if imm12<11:10> == '00' then
        case imm12<9:8> of
            when '00'
                imm32 = ZeroExtend(imm12<7:0>, 32);
            when '01'
                imm32 = '00000000' : imm12<7:0> : '00000000' : imm12<7:0>;
            when '10'
                imm32 = imm12<7:0> : '00000000' : imm12<7:0> : '00000000';
            when '11'
                imm32 = imm12<7:0> : imm12<7:0> : imm12<7:0> : imm12<7:0>;
        carry_out = carry_in;
    else
        unrotated_value = ZeroExtend('1':imm12<6:0>, 32);
        (imm32, carry_out) = ROR_C(unrotated_value, UInt(imm12<11:7>));

    return (imm32, carry_out);
```

## F2.8 Additional pseudocode support for instruction descriptions

Earlier sections of this chapter include pseudocode that describes features of the execution of A32 and T32 instructions, see:

- *Pseudocode description of conditional execution* on page F2-2448.
- *Pseudocode description of instruction-specified shifts and rotates* on page F2-2450

The following subsection gives additional pseudocode support functions for some of the instructions described in *Alphabetical list of T32 and A32 base instruction set instructions* on page F6-2576. See also *Pseudocode support for the Banked register transfer instructions* on page F6-3205.

### F2.8.1 Pseudocode description of coprocessor operations

The `Coproc_CheckInstr()` pseudocode function determines whether a coprocessor instruction is accepted for execution, see *Pseudocode description of checking accesses to the conceptual coprocessors CP14 and CP15* on page G1-3840.

The `Coproc_DoneLoading()` pseudocode function determines, for an `LDC` instruction, whether enough words have been loaded:

```
boolean Coproc_DoneLoading(integer cp_num, bits(32) instr);
```

The `Coproc_DoneStoring()` function determines for an `STC` instruction whether enough words have been stored:

```
boolean Coproc_DoneStoring(integer cp_num, bits(32) instr);
```

The `Coproc_GetOneWord()` function obtains the word for an `MRC` instruction from the coprocessor:

```
bits(32) Coproc_GetOneWord(integer cp_num, bits(32) instr);
```

The `Coproc_GetTwoWords()` function obtains the two words for an `MRRC` instruction from the coprocessor:

```
(bits(32), bits(32)) Coproc_GetTwoWords(integer cp_num, bits(32) instr);
```

**Note**

The relative significance of the two words returned is IMPLEMENTATION DEFINED, but all uses within this manual present the two words in the order (most significant, least significant).

The `Coproc_GetWordToStore()` function obtains the next word to store for an `STC` instruction from the coprocessor:

```
bits(32) Coproc_GetWordToStore(integer cp_num, bits(32) instr);
```

The `Coproc_InternalOperation()` procedure instructs a coprocessor to perform the internal operation requested by a `CDP` instruction:

```
Coproc_InternalOperation(integer cp_num, bits(32) instr);
```

The `Coproc_SendLoadedWord()` procedure sends a loaded word for an `LDC` instruction to the coprocessor:

```
Coproc_SendLoadedWord(bits(32) word, integer cp_num, bits(32) instr);
```

The `Coproc_SendOneWord()` procedure sends the word for an `MCR` instruction to the coprocessor:

```
Coproc_SendOneWord(bits(32) word, integer cp_num, bits(32) instr);
```

The `Coproc_SendTwoWords()` procedure sends the two words for an `MCRR` instruction to the coprocessor:

```
Coproc_SendTwoWords(bits(32) word2, bits(32) word1, integer cp_num, bits(32) instr);
```

**Note**

The relative significance of `word2` and `word1` is IMPLEMENTATION DEFINED, but all uses within this manual treat `word2` as more significant than `word1`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

The CP14DebugInstrDecode() pseudocode function decodes an accepted access to a CP14 debug register:

```
boolean CP15InstrDecode(bits(32) instr);
```

The CP14JazelleInstrDecode() pseudocode function decodes an accepted access to a CP14 Jazelle register:

```
boolean CP14JazelleInstrDecode(bits(32) instr);
```

The CP14TraceInstrDecode() pseudocode function decodes an accepted access to a CP14 Trace register:

```
boolean CP14TraceInstrDecode(bits(32) instr);
```

The CP15InstrDecode() pseudocode function decodes an accepted access to a CP15 register:

```
boolean CP15InstrDecode(bits(32) instr);
```

### F2.8.2 Pseudocode details of system calls

The CallSupervisor() pseudocode function generates a Supervisor Call exception. Valid execution of the SVC instruction calls this function.

```
// AArch32.CallSupervisor()
// ========================
// Calls the Supervisor

AArch32.CallSupervisor(bits(16) immediate)

    if AArch32.CurrentCond() != '1110' then
        immediate = bits(16) UNKNOWN;

    if AArch32.GeneralExceptionsToAArch64() then
        AArch64.CallSupervisor(immediate);
    else
        AArch32.TakeSVCException(immediate);
```

The CallHypervisor() pseudocode function generates an HVC exception. Valid execution of the HVC instruction calls this function.

```
// AArch32.CallHypervisor()
// ========================
// Performs a HVC call

AArch32.CallHypervisor(bits(16) immediate)
    assert HaveEL(EL2);

    if !ELUsingAArch32(EL2) then
        AArch64.CallHypervisor(immediate);
    else
        AArch32.TakeHVCException(immediate);
```

# Chapter F3
# T32 Base Instruction Set Encoding

This chapter introduces the T32 instruction set and describes how it uses the ARM programmers' model. It contains the following sections:

- *Top level T32 instruction set encoding* on page F3-2464.
- *16-bit T32 instruction encoding* on page F3-2465.
- *32-bit T32 instruction encoding* on page F3-2476.

**Note**

In the decode tables in this chapter, an entry of - for a field value means the value of the field does not affect the decoding.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## F3.1 Top level T32 instruction set encoding

The T32 instruction stream is a sequence of halfword-aligned halfwords. Each T32 instruction is either a single 16-bit halfword in that stream, or a 32-bit instruction consisting of two consecutive halfwords in that stream.

If the value of bits[15:11] of the halfword being decoded is one of the following, the halfword is the first halfword of a 32-bit instruction:

- `0b11101`.
- `0b11110`.
- `0b11111`.

Otherwise, the halfword is a 16-bit instruction.

For more information on T32 instruction encodings see *About the T32 and A32 instruction encodings* on page F2-2454.

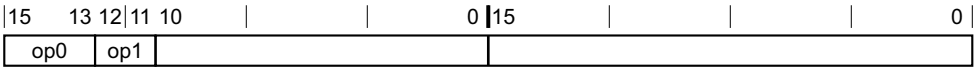

**Table F3-1 Main encoding table for the T32 instruction set**

| Decode fields | | Decode group or instruction page |

## F3.2 16-bit T32 instruction encoding

This section describes the encoding of the 16-bit T32 instruction encoding group. This section is decoded from *Top level T32 instruction set encoding* on page F3-2464.

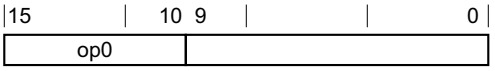

**Table F3-2 Encoding table for the 16-bit group**

| Decode fields | Decode group or instruction page |
|---|---|
| **op0** | |
| 00xxxx | *Shift (immediate), add, subtract, move, and compare* |
| 010000 | *Data-processing (two low registers)* on page F3-2467 |
| 010001 | *Special data instructions and branch and exchange* on page F3-2468 |
| 01001x | LDR (literal) - T1 variant |
| 0101xx | *Load/store (register offset)* on page F3-2469 |
| 011xxx | *Load/store word/byte (immediate offset)* on page F3-2469 |
| 1000xx | *Load/store halfword (immediate offset)* on page F3-2470 |
| 1001xx | *Load/store (SP-relative)* on page F3-2470 |
| 1010xx | *Add PC/SP (immediate)* on page F3-2471 |
| 1011xx | *Miscellaneous 16-bit instructions* on page F3-2471 |
| 1100xx | *Load/store multiple* on page F3-2474 |
| 1101xx | *Conditional branch, and Supervisor Call* on page F3-2474 |

### F3.2.1 Shift (immediate), add, subtract, move, and compare

This section describes the encoding of the Shift (immediate), add, subtract, move, and compare group. This section is decoded from *16-bit T32 instruction encoding*.

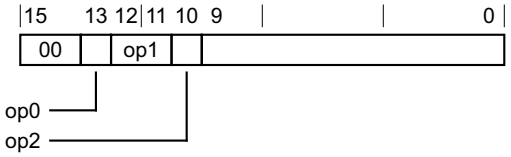

**Table F3-3 Encoding table for the Shift (immediate), add, subtract, move, and compare group**

| Decode fields | | | Decode group or instruction page |
|---|---|---|---|
| **op0** | **op1** | **op2** | |
| 0 | 11 | 0 | *Add, subtract (three low registers)* on page F3-2466 |

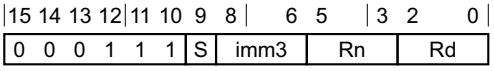
Non-Confidential - Beta

**Table F3-3 Encoding table for the Shift (immediate), add, subtract, move, and compare group**

| Decode fields | | | Decode group or instruction page |
|---|---|---|---|
| op0 | op1 | op2 | |
| 0 | 11 | 1 | *Add, subtract (two low registers and immediate)* |
| 0 | != 11 | - | MOV, MOVS (register) - T2 variant |
| 1 | - | - | *Add, subtract, compare, move (one low register and immediate)* |

## Add, subtract (three low registers)

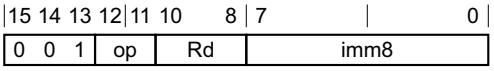


This section describes the encoding of the Add, subtract (three low registers) instruction class. This section is decoded from *Shift (immediate), add, subtract, move, and compare* on page F3-2465.

| Decode fields | Instruction Page |
|---|---|
| S | |
| 0 | ADD, ADDS (register) |
| 1 | SUB, SUBS (register) |

## Add, subtract (two low registers and immediate)

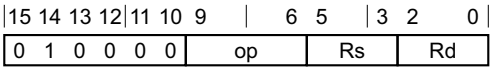
This section describes the encoding of the Add, subtract (two low registers and immediate) instruction class. This section is decoded from *Shift (immediate), add, subtract, move, and compare* on page F3-2465.



| Decode fields | Instruction Page |
|---|---|
| S | |
| 0 | ADD, ADDS (immediate) |
| 1 | SUB, SUBS (immediate) |

## Add, subtract, compare, move (one low register and immediate)

This section describes the encoding of the Add, subtract, compare, move (one low register and immediate) instruction class. This section is decoded from *Shift (immediate), add, subtract, move, and compare* on page F3-2465.



*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

| Decode fields | Instruction Page |
|---|---|
| op | |
| 00 | MOV, MOVS (immediate) |
| 01 | CMP (immediate) |
| 10 | ADD, ADDS (immediate) |
| 11 | SUB, SUBS (immediate) |

### F3.2.2 Data-processing (two low registers)

This section describes the encoding of the Data-processing (two low registers) instruction class. This section is decoded from *16-bit T32 instruction encoding* on page F3-2465.

| Decode fields | Instruction Page |
|---|---|
| op | |
| 0000 | AND, ANDS (register) |
| 0001 | EOR, EORS (register) |
| 0010 | MOV, MOVS (register-shifted register) - Logical shift left variant |
| 0011 | MOV, MOVS (register-shifted register) - Logical shift right variant |
| 0100 | MOV, MOVS (register-shifted register) - Arithmetic shift right variant |
| 0101 | ADC, ADCS (register) |
| 0110 | SBC, SBCS (register) |
| 0111 | MOV, MOVS (register-shifted register) - Rotate right variant |
| 1000 | TST (register) |
| 1001 | RSB, RSBS (immediate) |
| 1010 | CMP (register) |
| 1011 | CMN (register) |
| 1100 | ORR, ORRS (register) |

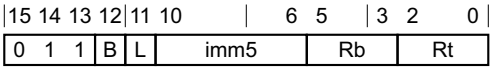
| 01 | - | - | CMP (register) |
| 10 | - | - | MOV, MOVS (register) |

### F3.2.4 Load/store (register offset)

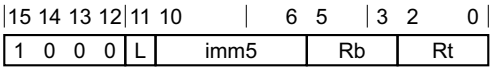
This section describes the encoding of the Load/store (register offset) instruction class. This section is decoded from *16-bit T32 instruction encoding* on page F3-2465.



| Decode fields | | | Instruction Page |
|---|---|---|---|
| L | B | H | |
| 0 | 0 | 0 | STR (register) |
| 0 | 0 | 1 | STRH (register) |
| 0 | 1 | 0 | STRB (register) |
| 0 | 1 | 1 | LDRSB (register) |
| 1 | 0 | 0 | LDR (register) |
| 1 | 0 | 1 | LDRH (register) |
| 1 | 1 | 0 | LDRB (register) |
| 1 | 1 | 1 | LDRSH (register) |

### F3.2.5 Load/store word/byte (immediate offset)

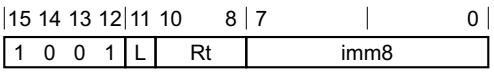
This section describes the encoding of the Load/store word/byte (immediate offset) instruction class. This section is decoded from *16-bit T32 instruction encoding* on page F3-2465.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

| Decode fields | | Instruction Page |
|---|---|---|
| B | L | |
| 0 | 0 | STR (immediate) |
| 0 | 1 | LDR (immediate) |
| 1 | 0 | STRB (immediate) |
| 1 | 1 | LDRB (immediate) |

### F3.2.6 Load/store halfword (immediate offset)

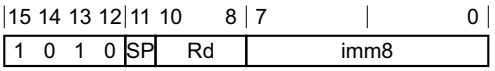


This section describes the encoding of the Load/store halfword (immediate offset) instruction class. This section is decoded from *16-bit T32 instruction encoding* on page F3-2465.

| Decode fields | Instruction Page |
|---|---|
| L | |
| 0 | STRH (immediate) |
| 1 | LDRH (immediate) |

### F3.2.7 Load/store (SP-relative)

This section describes the encoding of the Load/store (SP-relative) instruction class. This section is decoded from *16-bit T32 instruction encoding* on page F3-2465.



| Decode fields | Instruction Page |
|---|---|
| L | |
| 0 | STR (immediate) |
| 1 | LDR (immediate) |

### Saturate, Bitfield

This section describes the encoding of the Saturate, Bitfield instruction class. This section is decoded from *Data-processing (plain binary immediate)* on page F3-2490.

| Decode fields | | | Instruction Page |
|---|---|---|---|
| op1 | Rn | imm3:imm2 | |
| 000 | - | - | SSAT - Logical shift left variant |
| 001 | - | != 00000 | SSAT - Arithmetic shift right variant |
| 001 | - | 00000 | SSAT16 |
| 010 | - | - | SBFX |
| 011 | != 1111 | - | BFI |
| 011 | 1111 | - | BFC |
| 100 | - | - | USAT - Logical shift left variant |
| 101 | - | != 00000 | USAT - Arithmetic shift right variant |
| 101 | - | 00000 | USAT16 |
| 110 | - | - | UBFX |
| 111 | - | - | Unallocated. |

## F3.3.8 Load/store single

This section describes the encoding of the Load/store single group. This section is decoded from *32-bit T32 instruction encoding* on page F3-2476.

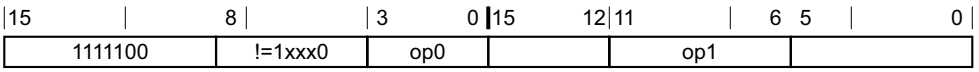

**Table F3-13 Encoding table for the Load/store single group**

| Decode fields | | Decode group or instruction page |
|---|---|---|
| op0 | op1 | |
| != 1111 | 000000 | *Load/store (register offset)* on page F3-2493 |
| != 1111 | 10x0xx | Unallocated. |
| != 1111 | 10x1xx | *Load/store (immediate, post-indexed)* on page F3-2493 |
| != 1111 | 1100xx | *Load/store (negative immediate)* on page F3-2494 |
| != 1111 | 1110xx | *Load/store (unprivileged)* on page F3-2495 |

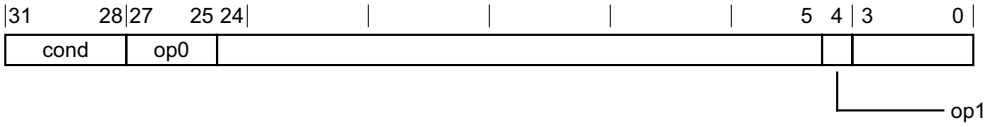
# Chapter F4
# A32 Base Instruction Set Encoding

This chapter describes the encoding of the A32 instruction set. It contains the following sections:

- *Top level A32 instruction set encoding* on page F4-2508.
- *Data-processing and miscellaneous instructions* on page F4-2509.
- *Load/Store Word, Unsigned Byte (immediate, literal)* on page F4-2525.
- *Load/Store Word, Unsigned Byte (register)* on page F4-2526.
- *Media instructions* on page F4-2527.
- *Branch, branch with link, and block data transfer* on page F4-2535.
- *Coprocessor instructions, and Supervisor Call* on page F4-2537.
- *Unconditional instructions* on page F4-2541.



**Note**

In the decode tables in this chapter, an entry of - for a field value means the value of the field does not affect the decoding.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*

## F4.1 Top level A32 instruction set encoding

The A32 instruction stream is a sequence of word-aligned words. Each A32 instruction is a single 32-bit word in that stream. The encoding of an A32 instruction is:

Most A32 instructions can be conditional, with a condition determined by bits[31:28] of the instruction, the `cond` field. For more information see *The condition code field in A32 instruction encodings* on page F2-2448. This applies to all instructions except those with the `cond` field equal to `0b1111`.

Table F4-1 shows the top-level encoding of the A32 instruction set, including the cases where bits[31:28] are defined as `0b1111` rather than as the `cond`.

For more information on A32 instruction encodings see *About the T32 and A32 instruction encodings* on page F2-2454.

**Table F4-1 Main encoding table for the A32 instruction set**

| Decode fields | | | Decode group or instruction page |
|---|---|---|---|
| **cond** | **op0** | **op1** | |
| != 1111 | 00x | - | *Data-processing and miscellaneous instructions* on page F4-2509 |
| != 1111 | 010 | - | *Load/Store Word, Unsigned Byte (immediate, literal)* on page F4-2525 |
| != 1111 | 011 | 0 | *Load/Store Word, Unsigned Byte (register)* on page F4-2526 |
| != 1111 | 011 | 1 | *Media instructions* on page F4-2527 |
| - | 10x | - | *Branch, branch with link, and block data transfer* on page F4-2535 |
| - | 11x | - | *Coprocessor instructions, and Supervisor Call* on page F4-2537 |
| 1111 | 0xx | - | *Unconditional instructions* on page F4-2541 |

## F4.2 Data-processing and miscellaneous instructions

This section describes the encoding of the Data-processing and miscellaneous instructions group. This section is decoded from *Top level A32 instruction set encoding* on page F4-2508.

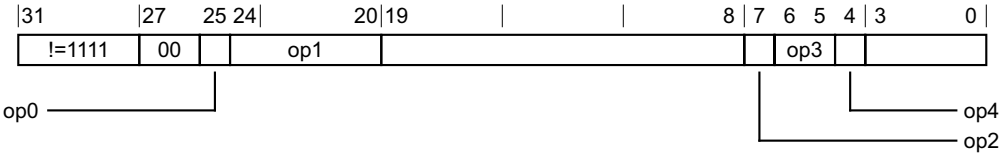

**Table F4-2 Encoding table for the Data-processing and miscellaneous instructions group**

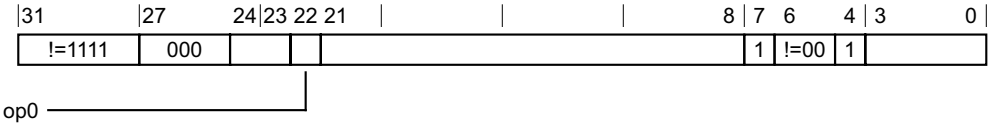
| Decode fields | | | | | Decode group or instruction page |
|---|---|---|---|---|---|
| op0 | op1 | op2 | op3 | op4 | |
| 0 | - | 1 | != 00 | 1 | *Extra load/store* |
| 0 | 0xxxx | 1 | 00 | 1 | *Multiply and Accumulate* on page F4-2512 |
| 0 | 1xxxx | 1 | 00 | 1 | *Synchronization primitives* on page F4-2512 |
| 0 | 10xx0 | 0 | - | - | *Miscellaneous* on page F4-2514 |
| 0 | 10xx0 | 1 | - | 0 | *Halfword Multiply and Accumulate* on page F4-2516 |
| 0 | != 10xx0 | - | - | 0 | *Data-processing register (immediate shift)* on page F4-2517 |
| 0 | != 10xx0 | 0 | - | 1 | *Data-processing register (register shift)* on page F4-2519 |
| 1 | - | - | - | - | *Data-processing immediate* on page F4-2521 |

### F4.2.1 Extra load/store

This section describes the encoding of the Extra load/store group. This section is decoded from *Data-processing and miscellaneous instructions*.



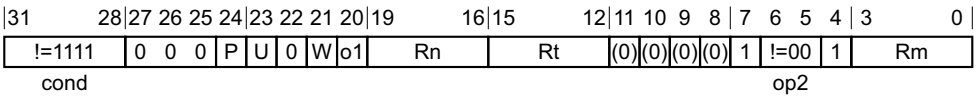


**Table F4-3 Encoding table for the Extra load/store group**

| Decode fields | Decode group or instruction page |
|---|---|
| op0 | |
| 0 | *Load/Store Dual, Half, Signed Byte (register)* |
| 1 | *Load/Store Dual, Half, Signed Byte (immediate, literal)* on page F4-2510 |

#### Load/Store Dual, Half, Signed Byte (register)

This section describes the encoding of the Load/Store Dual, Half, Signed Byte (register) instruction class. This section is decoded from *Extra load/store*.

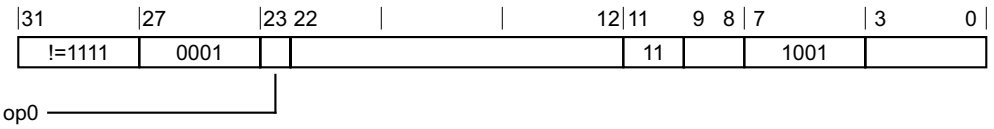
### F4.2.2 Multiply and Accumulate

This section describes the encoding of the Multiply and Accumulate instruction class. This section is decoded from *Data-processing and miscellaneous instructions* on page F4-2509.

| Decode fields | | Instruction Page |
|---|---|---|
| opc | S | |
| 000 | - | MUL, MULS |
| 001 | - | MLA, MLAS |
| 010 | 0 | UMAAL |
| 010 | 1 | Unallocated. |
| 011 | 0 | MLS |
| 011 | 1 | Unallocated. |
| 100 | - | UMULL, UMULLS |
| 101 | - | UMLAL, UMLALS |
| 110 | - | SMULL, SMULLS |
| 111 | - | SMLAL, SMLALS |

### F4.2.3 Synchronization primitives

This section describes the encoding of the Synchronization primitives group. This section is decoded from *Data-processing and miscellaneous instructions* on page F4-2509.



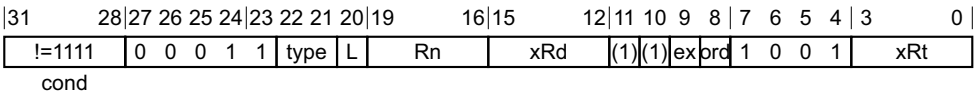


**Table F4-4 Encoding table for the Synchronization primitives group**

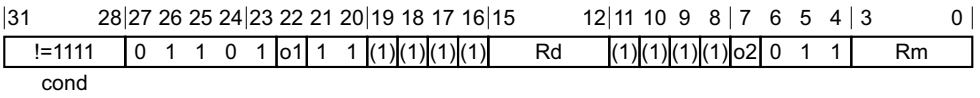
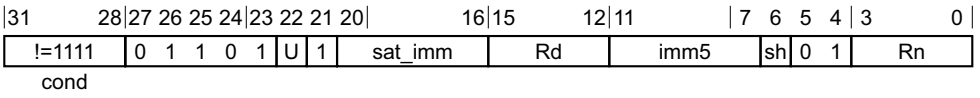
### F4.5.2 Saturate 16-bit



This section describes the encoding of the Saturate 16-bit instruction class. This section is decoded from *Media instructions* on page F4-2527.

| Decode fields | Instruction Page |
|---|---|
| U | |
| 0 | SSAT16 |
| 1 | USAT16 |

### F4.5.3 Reverse Bit/Byte

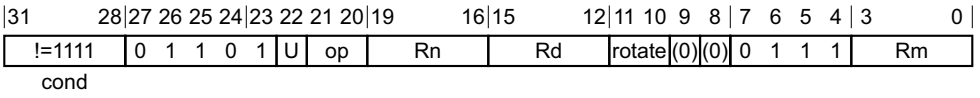


This section describes the encoding of the Reverse Bit/Byte instruction class. This section is decoded from *Media instructions* on page F4-2527.

| Decode fields | | Instruction Page |
|---|---|---|
| o1 | o2 | |
| 0 | 0 | REV |
| 0 | 1 | REV16 |
| 1 | 0 | RBIT |
| 1 | 1 | REVSH |

### F4.5.4 Saturate 32-bit

This section describes the encoding of the Saturate 32-bit instruction class. This section is decoded from *Media instructions* on page F4-2527.



| Decode fields | Instruction Page |
|---|---|
| U | |
| 0 | SSAT |
| 1 | USAT |

## F4.8 Unconditional instructions

This section describes the encoding of the Unconditional instructions group. This section is decoded from *Top level A32 instruction set encoding* on page F4-2508.

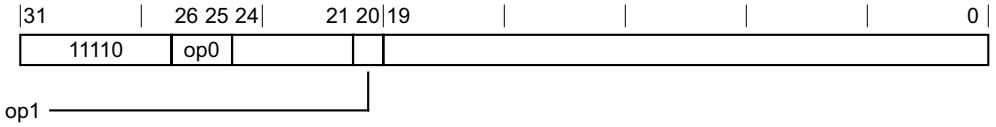

**Table F4-14 Encoding table for the Unconditional instructions group**

| Decode fields | | Decode group or instruction page |
|---|---|---|
| op0 | op1 | |
| 00 | - | *Miscellaneous* |
| 01 | - | For more information about this encoding see Chapter F5 *T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings*. |
| 1x | 1 | *Memory hints and barriers* on page F4-2542 |
| 10 | 0 | For more information about this encoding see Chapter F5 *T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings*. |
| 11 | 0 | Unallocated. |

### F4.8.1 Miscellaneous

This section describes the encoding of the Miscellaneous group. This section is decoded from *Unconditional instructions*.

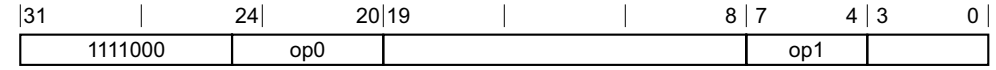

**Table F4-15 Encoding table for the Miscellaneous group**

| Decode fields | | Decode group or instruction page |
|---|---|---|
| op0 | op1 | |
| 0xxxx | - | Unallocated. |

# Chapter F5
# T32 and A32 Instruction Sets Advanced SIMD and floating-point Encodings

This chapter gives an overview of the Advanced SIMD and floating-point instruction sets. It contains the following sections:

- *Overview* on page F5-2546.
- *Advanced SIMD and floating-point instruction syntax* on page F5-2547.
- *Register encoding* on page F5-2551.
- *Advanced SIMD data-processing instructions* on page F5-2553.
- *Floating-point data-processing instructions* on page F5-2565.
- *Advanced SIMD and floating-point register load/store instructions* on page F5-2568.
- *Advanced SIMD element or structure load/store instructions* on page F5-2569.
- *8, 16, and 32-bit transfers accessing the SIMD and floating-point register file* on page F5-2572.
- *64-bit transfers accessing the SIMD and floating-point register file* on page F5-2573.

**Note**

- The Advanced SIMD architecture, its associated implementations, and supporting software, are commonly referred to as NEON™ technology.
- In the decode tables in this chapter, an entry of - for a field value means the value of the field does not affect the decoding.

*Non-Confidential - Beta*

# F5.1 Overview

All Advanced SIMD and floating-point instructions are available in both A32 and T32 instruction sets.

## F5.1.1 Advanced SIMD

The following sections describe the classes of Advanced SIMD instructions:

- *Advanced SIMD data-processing instructions* on page F5-2553.
- *Advanced SIMD element or structure load/store instructions* on page F5-2569.
- *Advanced SIMD and floating-point register load/store instructions* on page F5-2568.
- *8, 16, and 32-bit transfers accessing the SIMD and floating-point register file* on page F5-2572.
- *64-bit transfers accessing the SIMD and floating-point register file* on page F5-2573.

## F5.1.2 Floating-point

The following sections describe the classes of floating-point instructions:

- *Advanced SIMD and floating-point register load/store instructions* on page F5-2568.
- *8, 16, and 32-bit transfers accessing the SIMD and floating-point register file* on page F5-2572.
- *64-bit transfers accessing the SIMD and floating-point register file* on page F5-2573.
- *Floating-point data-processing instructions* on page F5-2565.

## F5.2 Advanced SIMD and floating-point instruction syntax

Advanced SIMD and floating-point instructions use the general conventions of the T32 and A32 instruction sets.

Advanced SIMD and floating-point data-processing instructions use the following general format:

```
V{<modifier>}<operation>{<shape>}{<c>}{<q>}{.<dt>}  {<dest>,} <src1>, <src2>
```

All Advanced SIMD and floating-point instructions begin with a `V`. This distinguishes Advanced SIMD vector and floating-point instructions from scalar instructions.

The main operation is specified in the `<operation>` field. It is usually a three letter mnemonic the same as or similar to the corresponding scalar integer instruction.

The `<c>` and `<q>` fields are standard assembler syntax fields. For details see *Standard assembler syntax fields* on page F2-2446.

### F5.2.1 Advanced SIMD instruction modifiers

The `<modifier>` field provides additional variants of some instructions. Table F5-1 provides definitions of the modifiers. Modifiers are not available for every instruction.

**Table F5-1 Advanced SIMD instruction modifiers**

| <modifier> | Meaning |
|---|---|
| Q | The operation uses saturating arithmetic. |
| R | The operation performs rounding. |
| D | The operation doubles the result (before accumulation, if any). |
| H | The operation halves the result. |

### F5.2.2 Advanced SIMD operand shapes

The `<shape>` field provides additional variants of some instructions. Table F5-2 provides definitions of the shapes. Operand shapes are not available for every instruction.

**Table F5-2 Advanced SIMD operand shapes**

| <shape> | Meaning | Typical register shape | |
|---|---|---|---|
| (none) | The operands and result are all the same width. | Dd, Dn, Dm | Qd, Qn, Qm |
| L | Long operation - result is twice the width of both operands | Qd, Dn, Dm | |
| N | Narrow operation - result is half the width of both operands | Dd, Qn, Qm | |
| W | Wide operation - result and first operand are twice the width of the second operand | Qd, Qn, Dm | |

**Note**

- Some assemblers support a Q shape specifier, that requires all operands to be Q registers. An example of using this specifier is `VADDQ.S32  q0, q1, q2`. This is not standard UAL, and ARM recommends that programmers do not use a Q shape specifier.
- A disassembler must not generate any shape specifier not shown in Table F5-2.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F5.2.3 Data type specifiers

The <dt> field normally contains one data type specifier. Unless the assembler syntax description for the instruction indicates otherwise, this indicates the data type contained in:

- The second operand, if any.
- The operand, if there is no second operand.
- The result, if there are no operand registers.

The data types of the other operand and result are implied by the <dt> field combined with the instruction shape. For information about data type formats see *Data types supported by the Advanced SIMD implementation* on page E1-2328.

In the instruction syntax descriptions in Chapter F2 *About the T32 and A32 Instruction Descriptions*, the <dt> field is usually specified as a single field. However, where more convenient, it is sometimes specified as a concatenation of two fields, <type><size>.

#### Syntax flexibility

There is some flexibility in the data type specifier syntax:

- Software can specify three data types, specifying the result and both operand data types. For example:

  `VSUBW.I16.I16.S8 Q3, Q5, D0` instead of `VSUBW.S8 Q3, Q5, D0`

- Software can specify two data types, specifying the data types of the two operands. The data type of the result is implied by the instruction shape. For example:

  `VSUBW.I16.S8 Q3, Q5, D0` instead of `VSUBW.S8 Q3, Q5, D0`

- Software can specify two data types, specifying the data types of the single operand and the result. For example:

  `VMOVN.I16.I32 D0, Q1` instead of `VMOVN.I32 D0, Q1`

- Where an instruction requires a less specific data type, software can instead specify a more specific type, as shown in Table F5-3.

- Where an instruction does not require a data type, software can provide one.

- The `F32` data type can be abbreviated to `F`.

- The `F64` data type can be abbreviated to `D`.

In all cases, if software provides additional information, the additional information must match the instruction shape. Disassembly does not regenerate this additional information.

**Table F5-3 Data type specification flexibility**

| Specified data type | Permitted more specific data types | | | | |
|---|---|---|---|---|---|
| None | Any | | | | |
| .I<size> | - | .S<size> | .U<size> | - | - |
| .8 | .I8 | .S8 | .U8 | .P8 | - |
| .16 | .I16 | .S16 | .U16 | .P16 | .F16 |
| .32 | .I32 | .S32 | .U32 | - | .F32 or .F |
| .64 | .I64 | .S64 | .U64 | - | .F64 or .D |

### F5.2.4 Register specifiers

The <dest>, <src1>, and <src2> fields contain register specifiers, or in some cases scalar specifiers or register lists. Table F5-4 shows the register and scalar specifier formats that appear in the instruction descriptions.

If <dest> is omitted, it is the same as <src1>.

**Table F5-4 Advanced SIMD and floating-point register specifier formats**

| <specifier> | Usual meaning [a] | Used in |
|---|---|---|
| <Qd> | A quadword destination register for the result vector. | Advanced SIMD |
| <Qn> | A quadword source register for the first operand vector. | Advanced SIMD |
| <Qm> | A quadword source register for the second operand vector. | Advanced SIMD |
| <Dd> | A doubleword destination register for the result vector. | Both |
| <Dn> | A doubleword source register for the first operand vector. | Both |
| <Dm> | A doubleword source register for the second operand vector. | Both |
| <Sd> | A singleword destination register for the result vector. | Floating-point |
| <Sn> | A singleword source register for the first operand vector. | Floating-point |
| <Sm> | A singleword source register for the second operand vector. | Floating-point |
| <Dd[x]> | A destination scalar for the result. Element x of vector <Dd>. | Advanced SIMD |
| <Dn[x]> | A source scalar for the first operand. Element x of vector <Dn>. | Both [b] |
| <Dm[x]> | A source scalar for the second operand. Element x of vector <Dm>. | Advanced SIMD |
| <Rt> | A general-purpose register, used for a source or destination address. | Both |
| <Rt2> | A general-purpose register, used for a source or destination address. | Both |
| <Rn> | A general-purpose register, used as a load or store base address. | Both |
| <Rm> | A general-purpose register, used as a post-indexed address source. | Both |

a. In some instructions the roles of registers are different.

b. In the floating-point instructions, <Dn[x]> is used only in VMOV (scalar to general-purpose register), see *VMOV (scalar to general-purpose register)* on page F7-3487.

### F5.2.5 Register lists

A register list is a list of register specifiers separated by commas and enclosed in brackets { and }. There are restrictions on what registers can appear in a register list. These restrictions are described in the individual instruction descriptions. Table F5-5 shows some register list formats, with examples of actual register lists corresponding to those formats.

**Note**

Register lists must not wrap around the end of the register bank.

#### Syntax flexibility

There is some flexibility in the register list syntax:

- Where a register list contains consecutive registers, they can be specified as a range, instead of listing every register, for example `{D0-D3}` instead of `{D0, D1, D2, D3}`.
- Where a register list contains an even number of consecutive doubleword registers starting with an even numbered register, it can be written as a list of quadword registers instead, for example `{Q1, Q2}` instead of `{D2-D5}`.
- Where a register list contains only one register, the enclosing braces can be omitted, for example `VLD1.8 D0, [R0]` instead of `VLD1.8 {D0}, [R0]`.

**Table F5-5 Example register lists**

| Format | Example | Alternative |
|---|---|---|
| `{<Dd>}` | `{D3}` | `D3` |
| `{<Dd>, <Dd+1>, <Dd+2>}` | `{D3, D4, D5}` | `{D3-D5}` |
| `{<Dd[x]>, <Dd+2[x]>}` | `{D0[3], D2[3]}` | - |
| `{<Dd[]>}` | `{D7[]}` | `D7[]` |

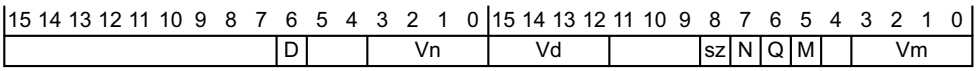
Non-Confidential - Beta

## F5.3 Register encoding

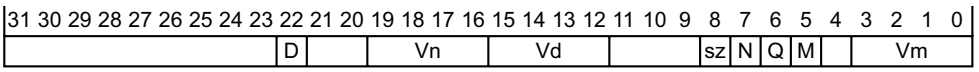
An Advanced SIMD register is either:

- *Quadword*, meaning it is 128 bits wide.
- *Doubleword*, meaning it is 64 bits wide.



Some instructions have options for either doubleword or quadword registers. This is normally encoded in Q, bit[6], as Q = 0 for doubleword operations, or Q = 1 for quadword operations.

A floating-point register is either:



- Double-precision, meaning it is 64 bits wide.
- Single-precision, meaning it is 32 bits wide.

This is encoded in the sz field, bit[8], as sz = 1 for double-precision operations, or sz = 0 for single-precision operations.

The T32 instruction encoding of Advanced SIMD or floating-point registers is:

The A32 instruction encoding of Advanced SIMD or floating-point registers is:

Some instructions use only one or two registers, and use the unused register fields as additional opcode bits.

Table F5-6 shows the encodings for the registers.

**Table F5-6 Encoding of register numbers**

| Register mnemonic | Usual usage | Register number encoded in[a] | Notes[a] | Used in |
|---|---|---|---|---|
| <Qd> | Destination (quadword) | D, Vd (bits[22, 15:13]) | bit[12] == 0[b] | Advanced SIMD |
| <Qn> | First operand (quadword) | N, Vn (bits[7, 19:17]) | bit[16] == 0[b] | Advanced SIMD |
| <Qm> | Second operand (quadword) | M, Vm (bits[5, 3:1]) | bit[0] == 0[b] | Advanced SIMD |
| <Dd> | Destination (doubleword) | D, Vd (bits[22, 15:12]) | - | Both |
| <Dn> | First operand (doubleword) | N, Vn (bits[7, 19:16]) | - | Both |
| <Dm> | Second operand (doubleword) | M, Vm (bits[5, 3:0]) | - | Both |
| <Sd> | Destination (single-precision) | Vd, D (bits[15:12, 22]) | - | Floating-point |
| <Sn> | First operand (single-precision) | Vn, N (bits[19:16, 7]) | - | Floating-point |
| <Sm> | Second operand (single-precision) | Vm, M (bits[3:0, 5]) | - | Floating-point |

a. Bit numbers given for the A32 instruction encoding. See the figures in this section for the equivalent bits in the T32 encoding.

b. If this bit is 1, the instruction is UNDEFINED.

Non-Confidential - Beta

### F5.3.1 Advanced SIMD scalars

Advanced SIMD scalars can be 8-bit, 16-bit, 32-bit, or 64-bit. Instructions other than multiply instructions can access any element in the register set. The instruction syntax refers to the scalars using an index into a doubleword vector. The descriptions of the individual instructions contain details of the encodings.

Table F5-7 shows the form of encoding for scalars used in multiply instructions. These instructions cannot access scalars in some registers. The descriptions of the individual instructions contain cross references to this section where appropriate.

32-bit Advanced SIMD scalars, when used as single-precision floating-point numbers, are equivalent to Floating-point single-precision registers. That is, `Dm[x]` in a 32-bit context (0 <= `m` <= 15, 0 <= `x` <=1) is equivalent to `S[2m + x]`.

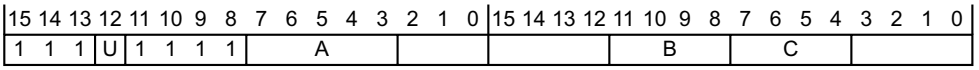

**Table F5-7 Encoding of scalars in multiply instructions**

| Scalar mnemonic | Usual usage | Scalar size | Register specifier | Index specifier | Accessible registers |
|---|---|---|---|---|---|
| `<Dm[x]>` | Second operand | 16-bit | Vm[2:0] | M, Vm[3] | D0-D7 |
| | | 32-bit | Vm[3:0] | M | D0-D15 |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

## F5.4 Advanced SIMD data-processing instructions

The T32 encoding of Advanced SIMD data processing instructions is:

The A32 encoding of Advanced SIMD data processing instructions is:

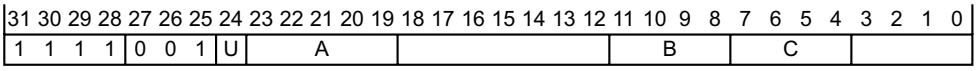

Table F5-8 shows the encoding for Advanced SIMD data-processing instructions. Other encodings in this space are UNDEFINED.

In these instructions, the U bit is in a different location in A32 and T32 instructions. This is bit[12] of the first halfword in the T32 encoding, and bit[24] in the A32 encoding. Other variable bits are in identical locations in the two encodings, after adjusting for the fact that the A32 encoding is held in memory as a single word and the T32 encoding is held as two consecutive halfwords.

The A32 instructions can only be executed unconditionally. The T32 instructions can be executed conditionally by using the `IT` instruction. For details see *IT* on page F6-2690.

**Table F5-15 Modified immediate values for Advanced SIMD instructions (continued)**

| op | cmode | Constant[a] | <dt>[b] | Notes |
|---|---|---|---|---|
| 0 | 1110 | abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh | I8 | f |
| | 1111 | aBbbbbbc defgh000 00000000 00000000 aBbbbbbc defgh000 00000000 00000000 | F32 | f, g |
| 1 | 1110 | aaaaaaaa bbbbbbbb cccccccc dddddddd eeeeeeee ffffffff gggggggg hhhhhhhh | I64 | f |
| | 1111 | UNDEFINED | - | - |

a. In this table, the immediate value is shown in binary form, to relate abcdefgh to the encoding diagram. In assembler syntax, the constant is specified by a data type and a value of that type. That value is specified in the normal way (a decimal number by default) and is replicated enough times to fill the 64-bit immediate. For example, a data type of `I32` and a value of 10 specify the 64-bit constant `0x0000000A0000000A`.

b. This specifies the data type used when the instruction is disassembled. On assembly, the data type must be matched in the table if possible. Other data types are permitted as pseudo-instructions when a program is assembled, provided the 64-bit constant specified by the data type and value is available for the instruction. If a constant is available in more than one way, the first entry in this table that can produce it is used. For example, `VMOV.I64 D0, #0x8000000080000000` does not specify a 64-bit constant that is available from the I64 line of the table, but does specify one that is available from the fourth I32 line or the F32 line. It is assembled to the first of these, and therefore is disassembled as `VMOV.I32 D0, #0x80000000`.

c. This constant is available for the `VBIC`, `VMOV`, `VMVN`, and `VORR` instructions.

d. UNPREDICTABLE if `abcdefgh` == 00000000.

e. This constant is available for the `VMOV` and `VMVN` instructions only.

f. This constant is available for the `VMOV` instruction only.

g. In this entry, `B` = NOT(`b`). The bit pattern represents the floating-point number $(-1)^S \times 2^{exp} \times$ mantissa, where S = `UInt(a)`, exp = `UInt(NOT(b):c:d)-3` and mantissa = `(16+UInt(e:f:g:h))/16`.

## F5.5 Floating-point data-processing instructions

The T32 encoding of floating-point data processing instructions is:

The A32 encoding of floating-point data processing instructions is:

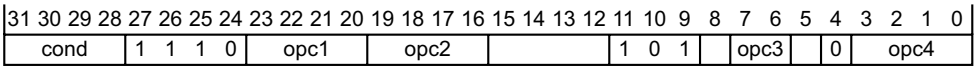

Table F5-16 shows the decode of these instructions. Other encodings in this space are UNDEFINED.

Table F5-16 shows the full decode of encodings for three-register floating-point data-processing instructions. *Other floating-point data processing instructions* on page F5-2566 shows the additional decoding of the other floating-point data-processing instructions.

These instructions are `CDP` instructions for coprocessors 10 and 11.

**Table F5-16 Three-register floating-point data-processing instructions**

| T[a] | opc1 | opc3 | Instruction | See |
|---|---|---|---|---|
| 0 | 0x00 | - | Vector Multiply Accumulate | *VMLA (floating-point)* on page F7-3450 |
| | 0x10 | - | Vector Multiply Subtract | *VMLS (floating-point)* on page F7-3462 |
| | 0x01 | x1 | Vector Negate Multiply Accumulate | *VNMLA* on page F7-3519 |
| | | x0 | Vector Negate Multiply Subtract | *VNMLS* on page F7-3521 |

**Table F5-18 Other floating-point data-processing instructions (continued)**

| T[a] | opc2 | opc3 | Instruction | See |
|---|---|---|---|---|
| 1 | 1000 | 01 | Floating-point Round to Integer to Nearest with Ties to Away | *VRINTA (floating-point)* on page F7-3619 |
| | 1001 | 01 | Floating-point Round to Integer to Nearest with Ties to Even | *VRINTN (floating-point)* on page F7-3627 |
| | 1010 | 01 | Floating-point Round to Integer towards +Infinity | *VRINTP (floating-point)* on page F7-3631 |
| | 1011 | 01 | Floating-point Round to Integer towards -Infinity | *VRINTM (floating-point)* on page F7-3623 |
| | 1100 | x1 | Floating-point Convert to Integer with Round to Nearest with Ties to Away | *VCVTA (floating-point)* on page F7-3345 |
| | 1101 | x1 | Floating-point Convert to Integer with Round to Nearest | *VCVTN (floating-point)* on page F7-3356 |
| | 1110 | x1 | Floating-point Convert to Integer with Round towards +Infinity | *VCVTP (floating-point)* on page F7-3360 |
| | 1111 | x1 | Floating-point Convert to Integer with Rounds towards -Infinity | *VCVTM (floating-point)* on page F7-3352 |

a. See Table F5-17 on page F5-2566 for the interpretation of this bit.

Table F5-19 shows the immediate constants available in the `VMOV` (immediate) instruction.

**Table F5-19 Floating-point modified immediate constants**

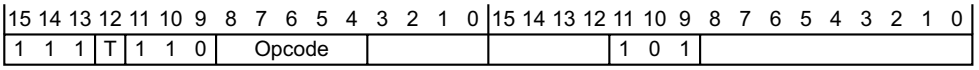
| Data type | opc2 | opc4 | Constant [a] |
|---|---|---|---|
| F32 | abcd | efgh | aBbbbbbc defgh000 00000000 00000000 |
| F64 | abcd | efgh | aBbbbbbb bbcdefgh 00000000 00000000 00000000 00000000 00000000 00000000 |

a. In this column, `B` = NOT(`b`). The bit pattern represents the floating-point number $(-1)^S \times 2^{exp} \times$ mantissa, where S = `UInt(a)`, exp = `UInt(NOT(b):c:d)-3` and mantissa = `(16+UInt(e:f:g:h))/16`.

## F5.5.2 Operation of modified immediate constants, floating-point

The `VFPExpandImm()` pseudocode function describes the operation of an immediate constant in a floating-point instruction.

```
// VFPExpandImm()
// ==============



bits(N) VFPExpandImm(bits(8) imm8)
    assert N IN {32,64};
    constant integer E = (if N == 32 then 8 else 11);
    constant integer F = N - E - 1;
    sign = imm8<7>;
    exp  = NOT(imm8<6>):Replicate(imm8<6>,E-3):imm8<5:4>;
    frac = imm8<3:0>:Zeros(F-4);
    return sign : exp : frac;
```

## F5.6 Advanced SIMD and floating-point register load/store instructions

These are instructions that transfer data to or from the registers in the SIMD and floating-point register file.

The T32 encoding of Advanced SIMD and floating-point register load or store instructions is:

The A32 encoding of Advanced SIMD and floating-point register load or store instructions is:

If `T` == 1 in the T32 encoding or `cond` == `0b1111` in the A32 encoding, the instruction is UNDEFINED.

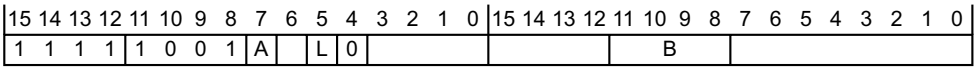
Otherwise, the allocation of encodings in this space is shown in Table F5-20. Other encodings in this space are UNDEFINED.

These instructions are `LDC` and `STC` instructions for coprocessors 10 and 11.

**Table F5-20 Advanced SIMD and floating-point register load/store instructions**

| Opcode | Instruction | See |
|---|---|---|
| 0010x | - | *64-bit transfers accessing the SIMD and floating-point register file* on page F5-2573 |
| 01xx0<br>10x10 | Vector Store Multiple[a] | *VSTM, VSTMDB, VSTMIA* on page F7-3711[a] |
| 1xx00 | Vector Store Register | *VSTR* on page F7-3714 |
| 01xx1<br>10x11 | Vector Load Multiple[b] | *VLDM, VLDMDB, VLDMIA* on page F7-3430[b] |
| 1xx01 | Vector Load Register | *VLDR* on page F7-3433 |

a. Previous descriptions of the T32/A32 Advanced SIMD and floating-point encodings have included `VPUSH`. This is an alias of an encoding of `VSTM`, and its encoding is now described in *VSTM, VSTMDB, VSTMIA* on page F7-3711.



b. Previous descriptions of the T32/A32 Advanced SIMD and floating-point encodings have included `VPOP`. This is an alias of an encoding of `VLDM`, and its encoding is now described in *VLDM, VLDMDB, VLDMIA* on page F7-3430.

## F5.7 Advanced SIMD element or structure load/store instructions

These are instructions that transfer data to or from Advanced SIMD elements or structures in the SIMD and floating-point register file.

The T32 encoding of Advanced SIMD element load or store instructions is:

The A32 encoding of Advanced SIMD element load or store instructions is:

The allocation of encodings in this space is shown in:

- Table F5-21 if L == 0. These are the encodings for store instructions.
- Table F5-22 on page F5-2570 if L == 1. These are the encodings for load instructions.

Other encodings in this space are UNDEFINED.

The variable bits are in identical locations in the two encodings, after adjusting for the fact that the A32 encoding is held in memory as a single word and the T32 encoding is held as two consecutive halfwords.

The A32 instructions can only be executed unconditionally. The T32 instructions can be executed conditionally by using the `IT` instruction. For details see *IT* on page F6-2690.

**Table F5-21 Element and structure store instructions (L == 0)**

| A | B | Instruction | See |
|---|---|---|---|
| 0 | 0010<br>011x<br>1010 | Vector Store | *VST1 (multiple single elements)* on page F7-3690 |

### F5.7.1 Advanced SIMD addressing mode

All the element and structure load/store instructions use this addressing mode. There is a choice of three formats:

`[<Rn>{:<align>}]`
: The address is contained in general-purpose register Rn.

  Rn is not updated by this instruction.

  Encoded as Rm = `0b1111`.

  If Rn is encoded as `0b1111`, the instruction is UNPREDICTABLE.

`[<Rn>{:<align>}]!`
: The address is contained in general-purpose register Rn.

  Rn is updated by this instruction: `Rn = Rn + transfer_size`

  Encoded as Rm = `0b1101`.

  `transfer_size` is the number of bytes transferred by the instruction. This means that, after the instruction is executed, Rn points to the address in memory immediately following the last address loaded from or stored to.

  If Rn is encoded as `0b1111`, the instruction is UNPREDICTABLE.

  This addressing mode can also be written as:

  `[<Rn>{:align}], #<transfer_size>`

  However, disassembly produces the `[<Rn>{:align}]!` form.

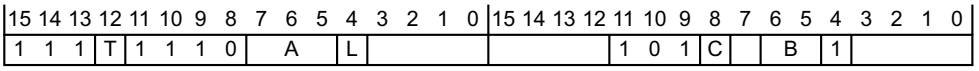
`[<Rn>{:<align>}], <Rm>`
: The address is contained in general-purpose register `<Rn>`.

  Rn is updated by this instruction: `Rn = Rn + Rm`

  Encoded as Rm = Rm. Rm must not be encoded as `0b1111` or `0b1101`, the PC or the SP.

  If Rn is encoded as `0b1111`, the instruction is UNPREDICTABLE.

In all cases, `<align>` specifies an alignment. Details are given in the individual instruction descriptions.



Previous versions of the manual used the `@` character for alignment. So, for example, the first format in this section was shown as `[<Rn>{@<align>}]`. Both `@` and `:` are supported. However, to ensure portability of code to assemblers that treat `@` as a comment character, `:` is preferred.

## F5.8 8, 16, and 32-bit transfers accessing the SIMD and floating-point register file

These are instructions that transfer data to or from registers in the SIMD and floating-point register file.

The T32 encoding of an Advanced SIMD and floating-point 8-bit, 16-bit, or 32-bit register data transfer instructions is:

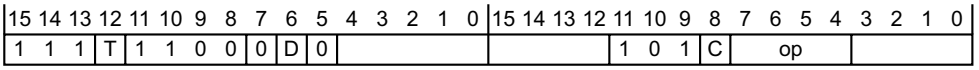
The A32 encoding of an Advanced SIMD and floating-point 8-bit, 16-bit, or 32-bit register data transfer instructions is:

If `T` == 1 in the T32 encoding or `cond` == `0b1111` in the A32 encoding, the instruction is UNDEFINED.

Otherwise, the allocation of encodings in this space is shown in Table F5-23. Other encodings in this space are UNDEFINED.

These instructions are `MRC` and `MCR` instructions for coprocessors 10 and 11.

**Table F5-23 8-bit, 16-bit and 32-bit Advanced SIMD and floating-point data transfer instructions**



| L | C | A | B | Instruction | See |
|---|---|---|---|---|---|
| 0 | 0 | 000 | - | Vector Move | *VMOV (between general-purpose register and single-precision register)* on page F7-3485 |
| | | 111 | - | Move to Advanced SIMD and Floating-point System register from general-purpose register | *VMSR* on page F7-3497 |
| 0 | 1 | 0xx | - | Vector Move | *VMOV (general-purpose register to scalar)* on page F7-3483 |

## F5.9 64-bit transfers accessing the SIMD and floating-point register file

These are instructions that transfer data to or from the registers in the SIMD and floating-point register file.

The T32 encoding of Advanced SIMD and floating-point 64-bit register data transfer instructions is:

The A32 encoding of Advanced SIMD and floating-point 64-bit register data transfer instructions is:

If `T` == 1 in the T32 encoding or `cond` == `0b1111` in the A32 encoding, the instruction is UNDEFINED.

Otherwise, the allocation of encodings in this space is shown in Table F5-24. Other encodings in this space are UNDEFINED.

These instructions are `MRRC` and `MCRR` instructions for coprocessors 10 and 11.

**Table F5-24 Advanced SIMD and floating-point 64-bit data transfer instructions**

| C | op | D | Instruction |
|---|---|---|---|
| 0 | 00x1 | 1 | *VMOV (between two general-purpose registers and two single-precision registers)* on page F7-3489 |
| 1 | 00x1 | 1 | *VMOV (between two general-purpose registers and a doubleword floating-point register)* on page F7-3474 |

# Chapter F6
# T32 and A32 Base Instruction Set Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of T32 and A32 base instruction set instructions* on page F6-2576.
- *Encoding and use of Banked register transfer instructions* on page F6-3202.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

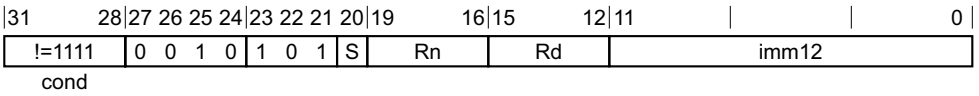
## F6.1 Alphabetical list of T32 and A32 base instruction set instructions

This section lists every instruction in the T32 and A32 base instruction sets. For details of the format used see *Format of instruction descriptions* on page F2-2442.

This section is formatted so that each instruction description starts on a new page.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F6.1.1 ADC, ADCS (immediate)



Add with Carry (immediate) adds an immediate value and the Carry flag value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

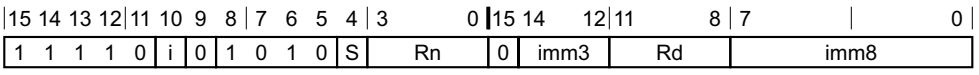
#### A1

##### *ADC variant*

Applies when S = 0.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *ADCS variant*



Applies when S = 1.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

#### T1

##### *ADC variant*

Applies when S = 0.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *ADCS variant*

Applies when S = 1.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE;  // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], imm32, PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

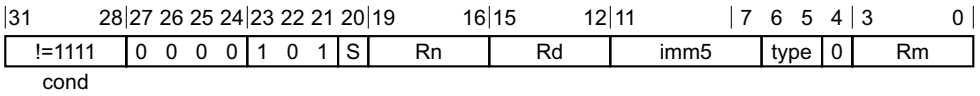
Non-Confidential - Beta

### F6.1.2 ADC, ADCS (register)



Add with Carry (register) adds a register value, the Carry flag value, and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *ADC, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *ADC, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

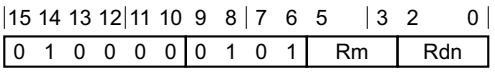
##### *ADCS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *ADCS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

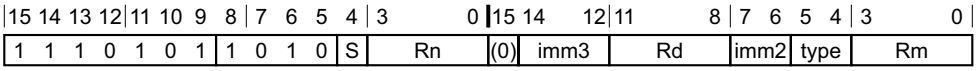
### T1



#### *T1 variant*

```
ADC<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
ADCS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *ADC, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ADC, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ADC<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *ADCS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && imm2 = 00 && type = 11`.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ADCS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ADCS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdn>` Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL` when `type = 00`

`LSR` when `type = 01`

`ASR` when `type = 10`

`ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

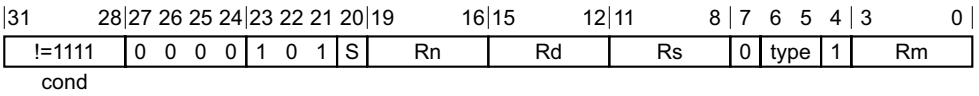
- Outside an IT block, if `ADCS <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `ADCS <Rd>, <Rn>` had been written.
- Inside an IT block, if `ADC<c> <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `ADC<c> <Rd>, <Rn>` had been written.

To prevent either of these happening, use the .W qualifier.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



```
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

### F6.1.3 ADC, ADCS (register-shifted register)

Add with Carry (register-shifted register) adds a register value, the Carry flag value, and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

#### A1

##### *Flag setting variant*

Applies when `S = 1`.

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Not flag setting variant*

Applies when `S = 0`.

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

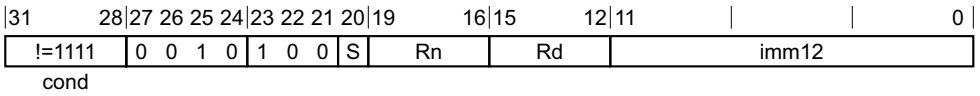
### F6.1.4 ADD, ADDS (immediate)



Add (immediate) adds an immediate value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

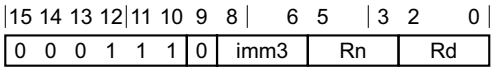
#### A1

##### *ADD variant*

Applies when S = 0 && Rn != 11x1.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *ADDS variant*



Applies when S = 1 && Rn != 1101.

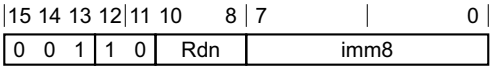
```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *Decode for all variants of this encoding*

```
if Rn == '1111' && S == '0' then SEE ADR;
if Rn == '1101' then SEE ADD (SP plus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

#### T1

##### *T1 variant*



```
ADD<c>{<q>} <Rd>, <Rn>, #<imm3> // Inside IT block
ADDS{<q>} <Rd>, <Rn>, #<imm3> // Outside IT block
```

##### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm3, 32);
```

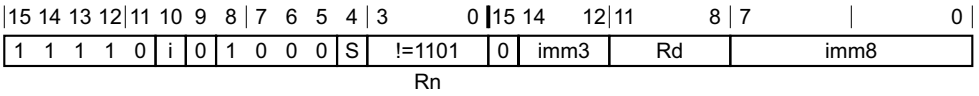
### T2



#### *T2 variant*

```
ADD<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
ADD<c>{<q>} {<Rdn>,} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
ADDS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
ADDS{<q>} {<Rdn>,} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1
```

#### *Decode for this encoding*

```
d = UInt(Rdn);  n = UInt(Rdn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm8, 32);
```

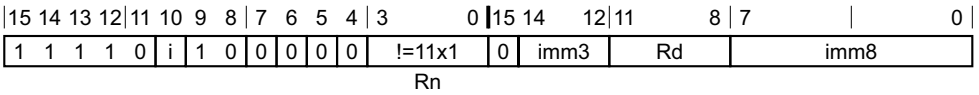
### T3

#### *ADD variant*

Applies when `S = 0`.

```
ADD<c>.W {<Rd>,} <Rn>, #<const> // Inside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or
T2
ADD{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *ADDS variant*



Applies when `S = 1 && Rd != 1111`.

```
ADDS.W {<Rd>,} <Rn>, #<const> // Outside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
ADDS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE CMN (immediate);
if Rn == '1101' then SEE ADD (SP plus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### T4

#### *T4 variant*

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
ADDW{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

#### *Decode for this encoding*

```
if Rn == '1111' then SEE ADR;
if Rn == '1101' then SEE ADD (SP plus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;   // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdn>` Is the general-purpose source and destination register, encoded in the "Rdn" field.

`<imm8>` Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction.

For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus immediate). If the PC is used, see ADR.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus immediate).

`<imm3>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T3: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

When multiple encodings of the same length are available for an instruction, encoding T3 is preferred to encoding T4 (if encoding T4 is required, use the `ADDW` syntax). Encoding T1 is preferred to encoding T2 if `<Rd>` is specified and encoding T2 is preferred to encoding T1 if `<Rd>` is omitted.

### Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        (result, nzcv) = AddWithCarry(R[n], imm32, '0');
        if d == 15 then          // Can only occur for A32 encoding
            if setflags then
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
                    ALUExceptionReturn(result);
                else
                    ALUWritePC(result);
            else
                R[d] = result;
                if setflags then
                    PSTATE.<N,Z,C,V> = nzcv;
    else
        if ConditionPassed() then
            EncodingSpecificOperations();
            (result, nzcv) = AddWithCarry(R[n], imm32, '0');
            R[d] = result;
            if setflags then
                PSTATE.<N,Z,C,V> = nzcv;
```

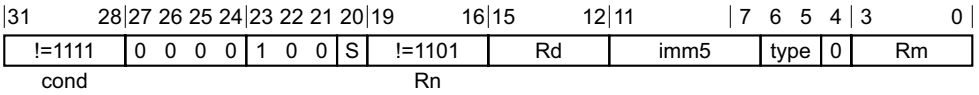
Non-Confidential - Beta

### F6.1.5 ADD, ADDS (register)



Add (register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *ADD, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *ADD, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

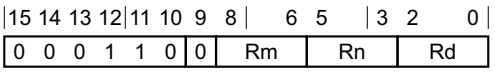
##### *ADDS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *ADDS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
if Rn == '1101' then SEE ADD (SP plus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

```

### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE CMN (register);
if Rn == '1101' then SEE ADD (SP plus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdn>` Is the general-purpose source and destination register, encoded in the "DN:Rdn" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318. The assembler language allows `<Rdn>` to be specified once or twice in the assembler syntax. When used inside an IT block, and `<Rdn>` and `<Rm>` are in the range R0 to R7, `<Rdn>` must be specified once so that encoding T2 is preferred to encoding T1. In all other cases there is no difference in behavior when `<Rdn>` is specified once or twice.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. When used inside an IT block, `<Rd>` must be specified. When used outside an IT block, `<Rd>` is optional, and:

- If omitted, this register is the same as `<Rn>`.
- If present, encoding T1 is preferred to encoding T2.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see ADD, ADDS (SP plus register).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus register).

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Rm>` For encoding A1 and T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T3: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL` when `type = 00`

`LSR` when `type = 01`

`ASR` when `type = 10`

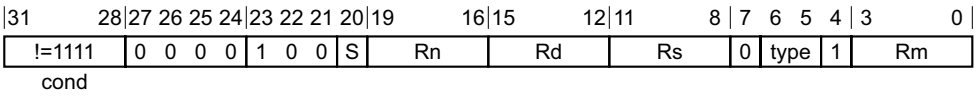
`ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Inside an IT block, if `ADD<c> <Rd>, <Rn>, <Rd>` cannot be assembled using encoding T1, it is assembled using encoding T2 as though `ADD<c> <Rd>, <Rn>` had been written. To prevent this happening, use the `.W` qualifier.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

### F6.1.6 ADD, ADDS (register-shifted register)

Add (register-shifted register) adds a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

#### A1

##### *Flag setting variant*

Applies when `S = 1`.

```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Not flag setting variant*

Applies when `S = 0`.

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

#### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Non-Confidential - Beta

### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

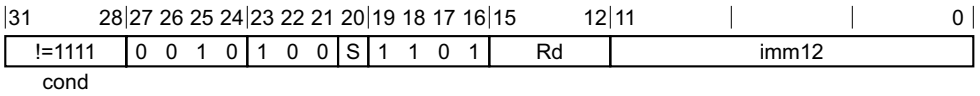
Non-Confidential - Beta

### F6.1.7 ADD, ADDS (SP plus immediate)



Add to SP (immediate) adds an immediate value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

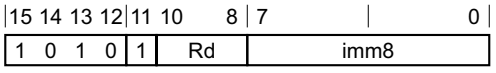
#### A1

##### *ADD variant*

Applies when `S = 0`.

```
ADD{<c>}{<q>} {<Rd>,} SP, #<const>
```

##### *ADDS variant*



Applies when `S = 1`.

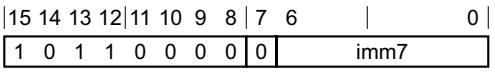
```
ADDS{<c>}{<q>} {<Rd>,} SP, #<const>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

#### T1

##### *T1 variant*



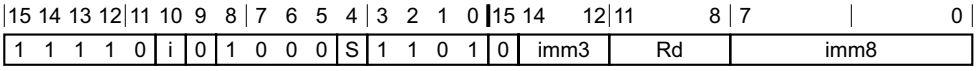
```
ADD{<c>}{<q>} <Rd>, SP, #<imm8>
```

##### *Decode for this encoding*

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(imm8:'00', 32);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T2



#### *T2 variant*

```
ADD{<c>}{<q>} {SP,} SP, #<imm7>
```

#### *Decode for this encoding*

```
d = 13;  setflags = FALSE;  imm32 = ZeroExtend(imm7:'00', 32);
```

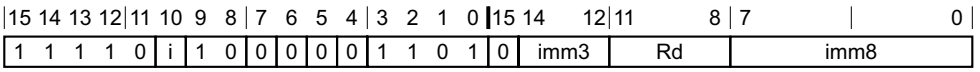
### T3

#### *ADD variant*

Applies when `S = 0`.

```
ADD{<c>}.W {<Rd>,} SP, #<const> // <Rd>, <const> can be represented in T1 or T2
ADD{<c>}{<q>} {<Rd>,} SP, #<const>
```

#### *ADDS variant*



Applies when `S = 1 && Rd != 1111`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, #<const>
```

#### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE CMN (immediate);
d = UInt(Rd);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 && !setflags then UNPREDICTABLE;
```

### T4

#### *T4 variant*

```
ADD{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
ADDW{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

#### *Decode for this encoding*

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<imm7> Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

For encoding T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<imm8> Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T3: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(SP, imm32, '0');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

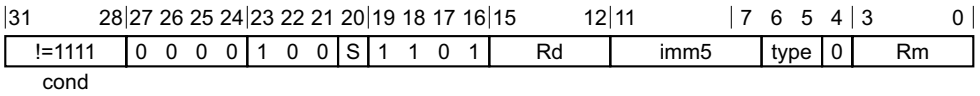
### F6.1.8 ADD, ADDS (SP plus register)



Add to SP (register) adds an optionally-shifted register value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ADDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *ADD, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
ADD{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

##### *ADD, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
ADD{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

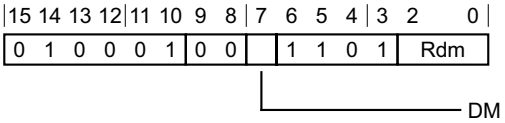
##### *ADDS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

##### *ADDS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

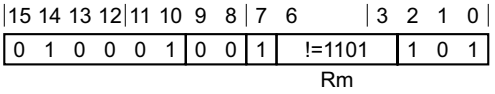
### T1



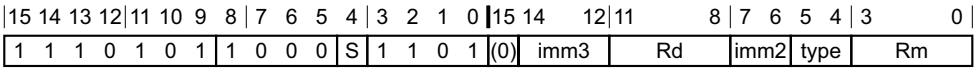
#### *T1 variant*

```
ADD{<c>}{<q>} {<Rdm>,} SP, <Rdm>
```

#### *Decode for this encoding*

```
d = UInt(DM:Rdm);  m = UInt(DM:Rdm);  setflags = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### T2



#### *T2 variant*

```
ADD{<c>}{<q>} {SP,} SP, <Rm>
```

#### *Decode for this encoding*

```
if Rm == '1101' then SEE encoding T1;
d = 13;  m = UInt(Rm);  setflags = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T3

#### *ADD, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
ADD{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

#### *ADD, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ADD{<c>}.W {<Rd>,} SP, <Rm> // <Rd>, <Rm> can be represented in T1 or T2
ADD{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

#### *ADDS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && Rd != 1111 && imm2 = 00 && type = 11`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### *ADDS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
ADDS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE CMN (register);
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdm>` Is the general-purpose destination and second source register, encoded in the "Rdm" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

`<Rm>` For encoding A1 and T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T3: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

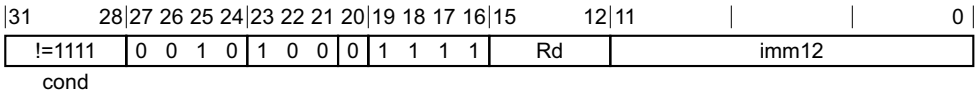
### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(SP, shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



### F6.1.9 ADD (immediate, to PC)

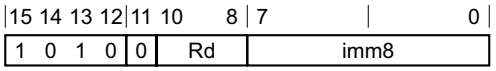
Add to PC adds an immediate value to the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias

This instruction is an alias of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The description of ADR gives the operational pseudocode for this instruction.

#### A1

##### *A1 variant*



```
ADD{<c>}{<q>} <Rd>, PC, #<const>
```

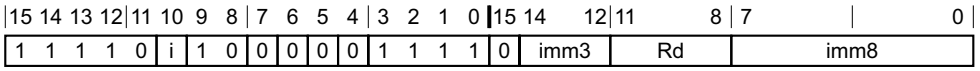
is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

#### T1

##### *T1 variant*



```
ADD{<c>}{<q>} <Rd>, PC, #<imm8>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

#### T3

##### *T3 variant*

```
ADDW{<c>}{<q>} <Rd>, PC, #<imm12> // <Rd>, <imm12> can be represented in T1
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

```
ADD{<c>}{<q>} <Rd>, PC, #<imm12>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is never the preferred disassembly.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T1 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<label>` For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset. If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F2-2456.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

`<imm8>` Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` An immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

### Operation for all encodings

The description of ADR gives the operational pseudocode for this instruction.

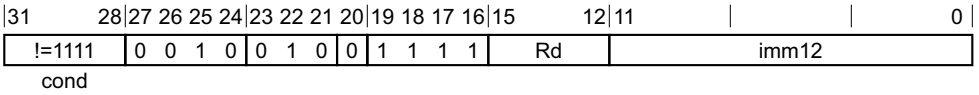
## F6.1.10 ADR

Form PC-relative address adds an immediate value to the PC value to form a PC-relative address, and writes the result to the destination register.

This instruction is used by the aliases ADD (immediate, to PC) and SUB (immediate, from PC). See the *Alias conditions* on page F6-2605 table for details of when each alias is preferred.

### A1



#### *A1 variant*

```
ADR{<c>}{<q>} <Rd>, <label>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  imm32 = A32ExpandImm(imm12);  add = TRUE;
```

### A2

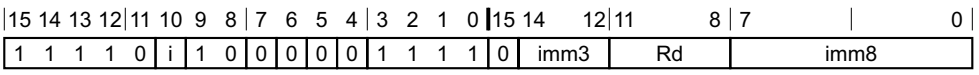
Non-Confidential - Beta



#### T2 variant

```
ADR{<c>}{<q>} <Rd>, <label>
```

#### Decode for this encoding

```
d = UInt(Rd);  imm32 = ZeroExtend(i:imm3:imm8, 32);  add = FALSE;
if d == 15 then UNPREDICTABLE;     // ARMv8-A removes UNPREDICTABLE for R13
```

### T3

#### T3 variant

```
ADR{<c>}.W <Rd>, <label> // <Rd>, <label> can be presented in T1
ADR{<c>}{<q>} <Rd>, <label>
```

#### Decode for this encoding

```
d = UInt(Rd);  imm32 = ZeroExtend(i:imm3:imm8, 32);  add = TRUE;
if d == 15 then UNPREDICTABLE;   // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Alias conditions

| Alias | of variant | is preferred when |
|---|---|---|
| ADD (immediate, to PC) | - | `Never` |
| SUB (immediate, from PC) | T2 | `i:imm3:imm8 = '000000000000'` |
| SUB (immediate, from PC) | A2 | `imm12==000000000000` |

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1 and A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<label> For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset. If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F2-2456.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

The instruction aliases permit the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if d == 15 then          // Can only occur for A32 encodings
        ALUWritePC(result);
    else
        R[d] = result;
```

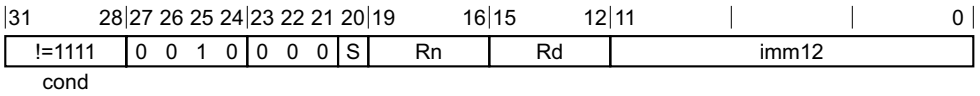
Non-Confidential - Beta

### F6.1.11 AND, ANDS (immediate)



Bitwise AND (immediate) performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *AND variant*

Applies when S = 0.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TST (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND imm32;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

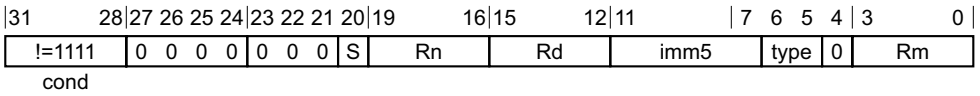
### F6.1.12 AND, ANDS (register)



Bitwise AND (register) performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *AND, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *AND, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

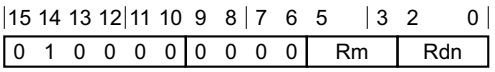
##### *ANDS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *ANDS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

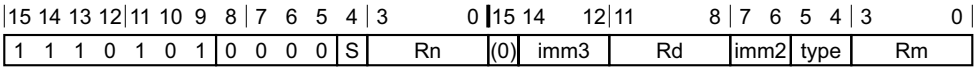
### T1



#### *T1 variant*

```
AND<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
ANDS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *AND, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *AND, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
AND<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *ANDS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && Rd != 1111 && imm2 = 00 && type = 11`.

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ANDS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
ANDS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE TST (register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdn>` Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL` when `type = 00`

`LSR` when `type = 01`

`ASR` when `type = 10`

`ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

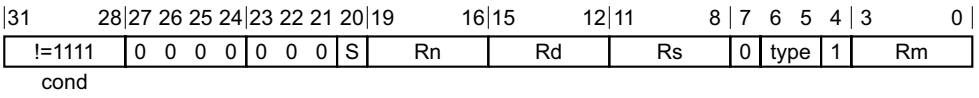
- Outside an IT block, if `ANDS <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `ANDS <Rd>, <Rn>` had been written.
- Inside an IT block, if `AND<c> <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `AND<c> <Rd>, <Rn>` had been written.

To prevent either of these happening, use the `.W` qualifier.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



```
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

### F6.1.13 AND, ANDS (register-shifted register)

Bitwise AND (register-shifted register) performs a bitwise AND of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

#### A1

##### *Flag setting variant*

Applies when `S = 1`.

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Not flag setting variant*

Applies when `S = 0`.

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### F6.1.14 ASR (immediate)

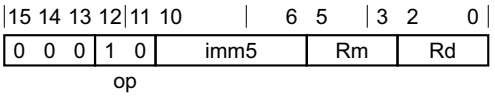
Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

#### A1

##### *MOV, shift or rotate by value variant*



```
ASR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

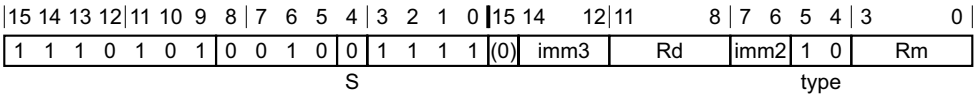
is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

#### T2

##### *T2 variant*



```
ASR<c>{<q>} {<Rd>,} <Rm>, #<imm> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is the preferred disassembly when `InITBlock()`.

#### T3

##### *MOV, shift or rotate by value variant*

```
ASR<c>.W {<Rd>,} <Rm>, #<imm> // Inside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

```
ASR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

### Operation for all encodings

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### F6.1.15 ASR (register)

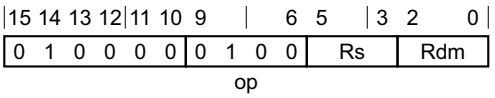
Arithmetic Shift Right (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

#### A1

##### *Not flag setting variant*



```
ASR{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

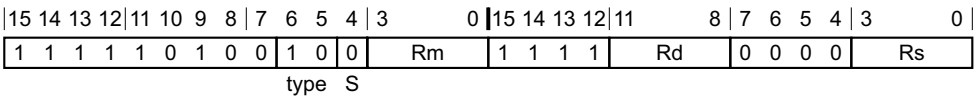
is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

and is always the preferred disassembly.

#### T1

##### *Arithmetic shift right variant*



```
ASR<c>{<q>} {<Rdm>,} <Rdm>, <Rs> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rdm>, <Rdm>, ASR <Rs>
```

and is the preferred disassembly when `InITBlock()`.

#### T2

##### *Not flag setting variant*

```
ASR<c>.W {<Rd>,} <Rm>, <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

and is always the preferred disassembly.

```
ASR{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ASR <Rs>
```

and is always the preferred disassembly.

### Assembler symbols

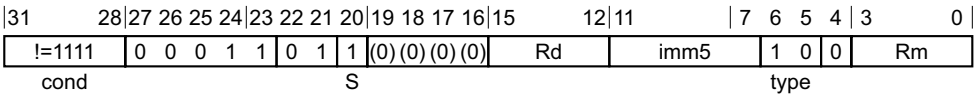
### F6.1.16 ASRS (immediate)

Arithmetic Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.



The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

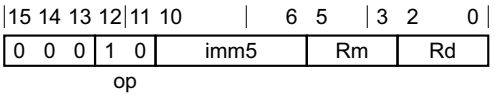
- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

#### A1

##### *MOVS, shift or rotate by value variant*



```
ASRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

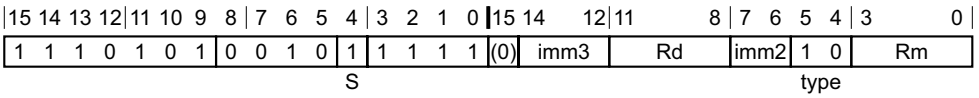
```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

#### T2

##### *T2 variant*

```
ASRS{<q>} {<Rd>,} <Rm>, #<imm> // Outside IT block
```



is equivalent to

```
MOVS{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is the preferred disassembly when `!InITBlock()`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T3

#### *MOVS, shift or rotate by value variant*

```
ASRS.W {<Rd>,} <Rm>, #<imm> // Outside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

```
ASRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>
```

and is always the preferred disassembly.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

## Operation for all encodings

### *T3 variant*

```
B<c>.W <label> // Not permitted in IT block, and <label> can be represented in T1
B<c>{<q>} <label> // Not permitted in IT block
```

### *Decode for this encoding*

```
if cond<3:1> == '111' then SEE "Related encodings";
imm32 = SignExtend(S:J2:J1:imm6:imm11:'0', 32);
if InITBlock() then UNPREDICTABLE;
```

## T4

### *T4 variant*

```
B{<c>}.W <label> // <label> can be represented in T2
B{<c>}{<q>} <label>
```

### *Decode for this encoding*

```
I1 = NOT(J1 EOR S);  I2 = NOT(J2 EOR S);  imm32 = SignExtend(S:I1:I2:imm10:imm11:'0', 32);
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

Related encodings: *Branches and miscellaneous control* on page F3-2485.

## Assembler symbols

<c> For encoding A1, T2 and T4: see *Standard assembler syntax fields* on page F2-2446.

For encoding T1: see *Standard assembler syntax fields* on page F2-2446. Must not be AL or omitted.

For encoding T3: see *Standard assembler syntax fields* on page F2-2446. <c> must not be AL or omitted.

<q> See *Standard assembler syntax fields* on page F2-2446.

<label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are multiples of 4 in the range –33554432 to 33554428.

For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –256 to 254.

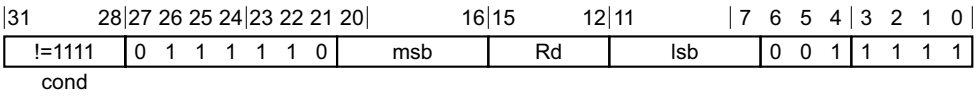
For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –2048 to 2046.

For encoding T3: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –1048576 to 1048574.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T4: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the `B` instruction to this label, then selects an encoding that sets `imm32` to that offset. Permitted offsets are even numbers in the range –16777216 to 16777214.

### Operation for all encodings



```

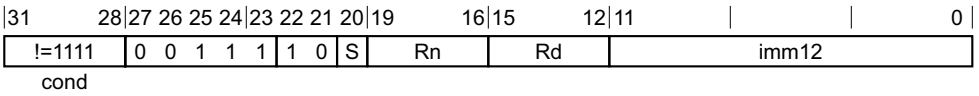
### F6.1.21 BIC, BICS (immediate)



Bitwise Bit Clear (immediate) performs a bitwise AND of a register value and the complement of an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

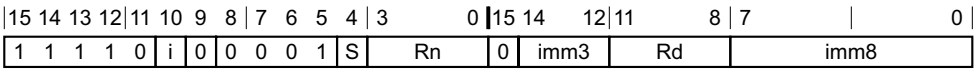
#### A1

##### *BIC variant*

Applies when S = 0.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *BICS variant*



Applies when S = 1.

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

#### T1

##### *BIC variant*

Applies when S = 0.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *BICS variant*

Applies when S = 1.

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### Decode for all variants of this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 || n == 15 then UNPREDICTABLE;  // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND NOT(imm32);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

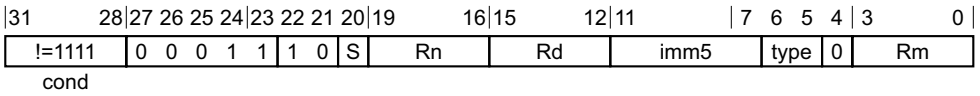
## F6.1.22 BIC, BICS (register)



Bitwise Bit Clear (register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### A1

#### *BIC, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *BIC, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

### F6.1.23 BIC, BICS (register-shifted register)

Bitwise Bit Clear (register-shifted register) performs a bitwise AND of a register value and the complement of a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

#### A1

##### *Flag setting variant*

Applies when `S = 1`.

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Not flag setting variant*

Applies when `S = 0`.

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

#### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

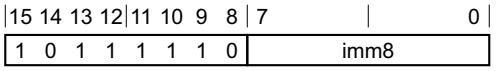
## F6.1.24 BKPT

Breakpoint causes a Software Breakpoint Instruction exception.

Breakpoint is always unconditional, even when inside an IT block.

### A1



#### *A1 variant*

```
BKPT{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
imm16 = imm12:imm4;
if cond != '1110' then UNPREDICTABLE;  // BKPT must be encoded with AL condition
```

### T1

#### *T1 variant*

```
BKPT{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
imm16 = ZeroExtend(imm8, 16);
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *BKPT* on page K1-5433.

## Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-2446. An BKPT instruction must be unconditional.

<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. The PE:

- Records this value in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
- Ignores this value otherwise.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. The PE:

- Records this value in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
- Ignores this value otherwise.

I1 = NOT(J1 EOR S);  I2 = NOT(J2 EOR S);  imm32 = SignExtend(S:I1:I2:imm10H:imm10L:'00', 32);
targetInstrSet = InstrSet_A32;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.

For encoding A2: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted.

<q> See *Standard assembler syntax fields* on page F2-2446.

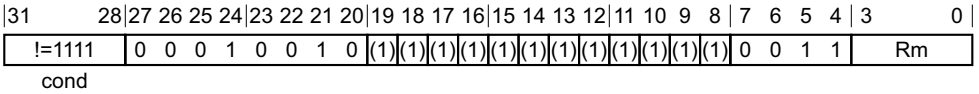
<label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are multiples of 4 in the range –33554432 to 33554428.

For encoding A2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are even numbers in the range –33554432 to 33554430.

For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are even numbers in the range –16777216 to 16777214.

For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the Align(PC, 4) value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset. Permitted offsets are multiples of 4 in the range –16777216 to 16777212.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    if CurrentInstrSet() == InstrSet_A32 then
        LR = PC - 4;
    else
        LR = PC<31:1> : '1';
    if targetInstrSet == InstrSet_A32 then
        targetAddress = Align(PC,4) + imm32;
    else
        targetAddress = PC + imm32;
    SelectInstrSet(targetInstrSet);
    BranchWritePC(targetAddress);
```

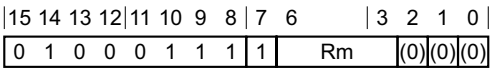
## F6.1.26 BLX (register)

Branch with Link and Exchange (register) calls a subroutine at an address specified in the register, and if necessary changes to the instruction set indicated by bit[0] of the register value. If the value in bit[0] is 0, the instruction set after the branch will be A32. If the value in bit[0] is 1, the instruction set after the branch will be T32.

### A1



#### *A1 variant*

```
BLX{<c>}{<q>} <Rm>
```

#### *Decode for this encoding*

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
BLX{<c>}{<q>} <Rm>
```

#### *Decode for this encoding*

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

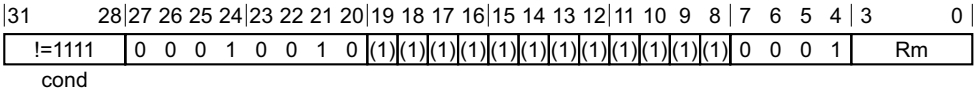
<q> See *Standard assembler syntax fields* on page F2-2446.

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The SP can be used, but this is deprecated.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    target = R[m];
    if CurrentInstrSet() == InstrSet_A32 then
        next_instr_addr = PC - 4;
        LR = next_instr_addr;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



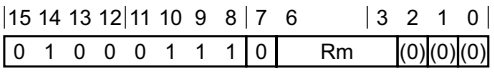
```
else
    next_instr_addr = PC - 2;
    LR = next_instr_addr<31:1> : '1';
BXWritePC(target);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.27 BX

Branch and Exchange causes a branch to an address and instruction set specified by a register.

### A1



#### *A1 variant*

```
BX{<c>}{<q>} <Rm>
```

#### *Decode for this encoding*

```
m = UInt(Rm);
```

### T1

#### *T1 variant*

```
BX{<c>}{<q>} <Rm>
```

#### *Decode for this encoding*

```
m = UInt(Rm);
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rm> For encoding A1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The SP can be used, but this is deprecated. The PC can be used.

For encoding T1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The SP can be used, but this is deprecated. The PC can be used.

**Note**

If <Rm> is the PC at a non word-aligned address, it results in UNPREDICTABLE behavior because the address passed to the `BXWritePC()` pseudocode function has bits<1:0> = '10'.

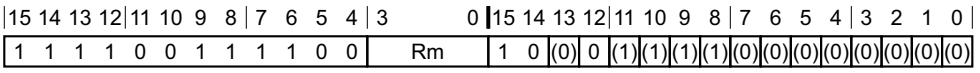
## F6.1.28 BXJ

Branch and Exchange, previously Branch and Exchange Jazelle.

In ARMv8, BXJ behaves as a BX instruction, see BX. This means it causes a branch to an address and instruction set specified by a register.

### A1



#### *A1 variant*

```
BXJ{<c>}{<q>} <Rm>
```

#### *Decode for this encoding*

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
BXJ{<c>}{<q>} <Rm>
```

#### *Decode for this encoding*

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;  // ARMv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

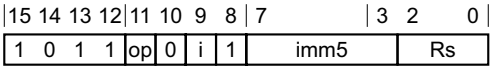
## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    BXWritePC(R[m]);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.29 CBNZ, CBZ

Compare and Branch on Nonzero and Compare and Branch on Zero compare the value in a register with zero, and conditionally branch forward a constant value. They do not affect the condition flags.

### T1

#### *CBNZ variant*

Applies when `op = 1`.

```
CBNZ{<q>} <Rn>, <label>
```

#### *CBZ variant*

Applies when `op = 0`.

```
CBZ{<q>} <Rn>, <label>
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);  imm32 = ZeroExtend(i:imm5:'0', 32);  nonzero = (op == '1');
if InITBlock() then UNPREDICTABLE;
```

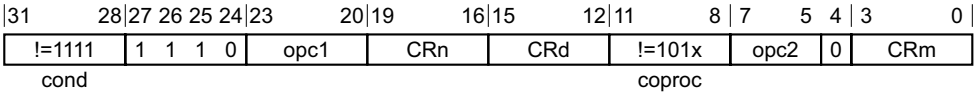
### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| `<q>` | See *Standard assembler syntax fields* on page F2-2446. |
| `<Rn>` | Is the general-purpose register to be tested, encoded in the "Rn" field. |
| `<label>` | Is the program label to be conditionally branched to. Its offset from the PC, a multiple of 2 and in the range 0 to 126, is encoded as "i:imm5" times 4. |

### Operation



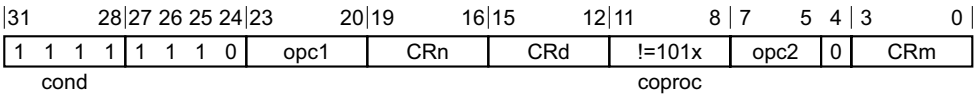
```
EncodingSpecificOperations();
if nonzero != IsZero(R[n]) then
    BranchWritePC(PC + imm32);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.30 CDP, CDP2

Coprocessor Data Processing is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the opc1, opc2, CRd, CRn, and CRm field values that are valid CDP and CDP2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

### A1



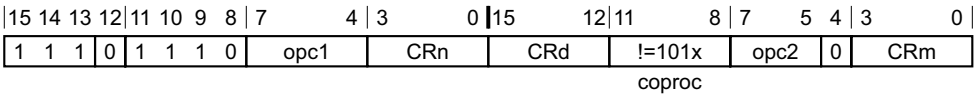
#### *A1 variant*

```
CDP{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

### A2



#### *A2 variant*

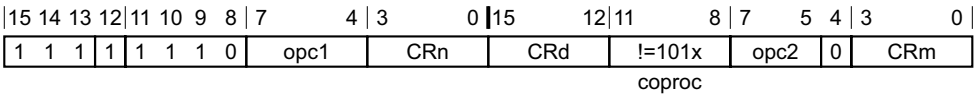
```
CDP2{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

### T1

#### *T1 variant*



```
CDP{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T2

#### *T2 variant*

```
CDP2{<c>}{<q>} <coproc>, {#}<opc1>, <CRd>, <CRn>, <CRm> {, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Floating-point instructions";
cp = UInt(coproc);
```

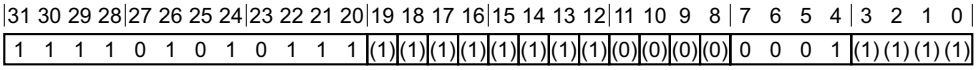
## Notes for all encodings

Floating-point instructions: Floating-point data-processing instructions.

## Assembler symbols

| | |
|---|---|
| <c> | For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.<br>For encoding A2: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <coproc> | Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15. |
| <opc1> | Is a coprocessor-specific opcode, in the range 0 to 15, encoded in the "opc1" field. |
| <CRd> | Is the destination coprocessor register, encoded in the "CRd" field. |
| <CRn> | Is the coprocessor register that contains the first operand, encoded in the "CRn" field. |
| <CRm> | Is the coprocessor register that contains the second operand, encoded in the "CRm" field. |
| <opc2> | Is a coprocessor-specific opcode in the range 0 to 7, defaulting to 0 and encoded in the "opc2" field. |

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    Coproc_InternalOperation(cp, ThisInstr());
```

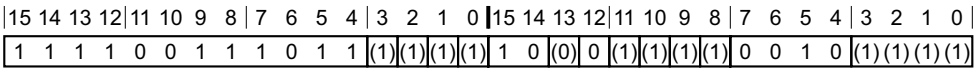
## F6.1.31 CLREX

Clear-Exclusive clears the local monitor of the executing PE.

### A1



#### *A1 variant*

```
CLREX{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1

#### *T1 variant*

```
CLREX{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### Notes for all encodings

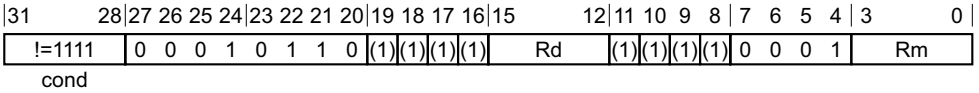
For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2446. Must be AL or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

### Operation for all encodings



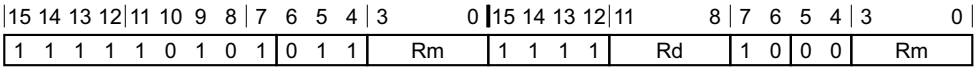
```
if ConditionPassed() then
    EncodingSpecificOperations();
    ClearExclusiveLocal(ProcessorID());
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.32 CLZ

Count Leading Zeros returns the number of binary zero bits before the first binary one bit in a value.

### A1



#### *A1 variant*

```
CLZ{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
CLZ{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
if !Consistent(Rm) then UNPREDICTABLE;
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

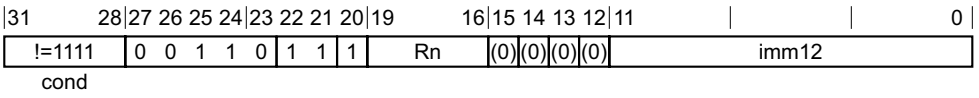
### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *CLZ* on page K1-5434.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rm> | For encoding A1: is the general-purpose source register, encoded in the "Rm" field.<br>For encoding T1: is the general-purpose source register, encoded in the "Rm" field. Its number must be encoded twice. |

### Operation for all encodings



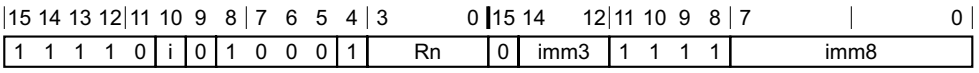
```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = CountLeadingZeroBits(R[m]);
    R[d] = result<31:0>;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F6.1.33 CMN (immediate)

Compare Negative (immediate) adds a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

#### A1



##### A1 variant

```
CMN{<c>}{<q>} <Rn>, #<const>
```

##### Decode for this encoding

```
n = UInt(Rn);  imm32 = A32ExpandImm(imm12);
```

#### T1

##### T1 variant

```
CMN{<c>}{<q>} <Rn>, #<const>
```

##### Decode for this encoding

```
n = UInt(Rn);  imm32 = T32ExpandImm(i:imm3:imm8);
if n == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

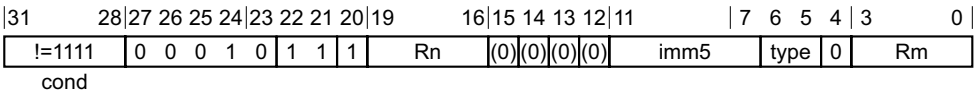
For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], imm32, '0');
    PSTATE.<N,Z,C,V> = nzcv;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.34 CMN (register)

Compare Negative (register) adds a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

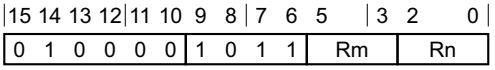
### A1

#### *Rotate right with extend variant*

Applies when `imm5 = 00000 && type = 11`.

```
CMN{<c>}{<q>} <Rn>, <Rm>, RRX
```

#### *Shift or rotate by value variant*



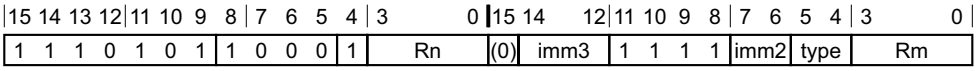
Applies when `!(imm5 == 00000 && type == 11)`.

```
CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

### T1



#### *T1 variant*

```
CMN{<c>}{<q>} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *Rotate right with extend variant*

Applies when `imm3 = 000 && imm2 = 00 && type = 11`.

```
CMN{<c>}{<q>} <Rn>, <Rm>, RRX
```

#### *Shift or rotate by value variant*

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
CMN{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1
CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

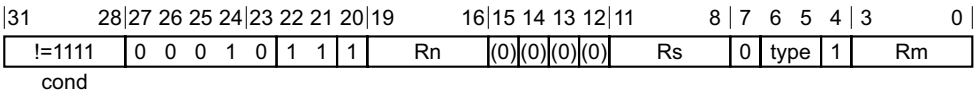
`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcv;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.35 CMN (register-shifted register)

Compare Negative (register-shifted register) adds a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

### A1

#### *A1 variant*

```
CMN{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

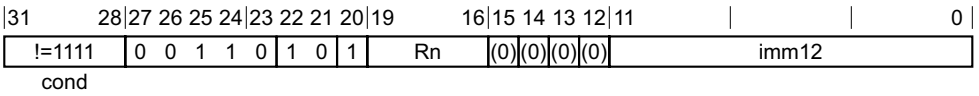
<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation



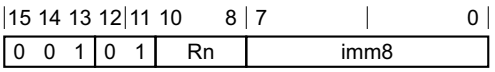
```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcv;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.36 CMP (immediate)

Compare (immediate) subtracts an immediate value from a register value. It updates the condition flags based on the result, and discards the result.

### A1



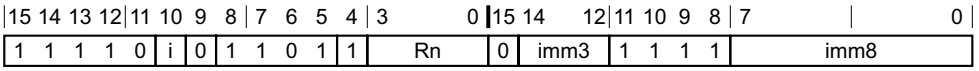
#### A1 variant

```
CMP{<c>}{<q>} <Rn>, #<const>
```

#### Decode for this encoding

```
n = UInt(Rn);  imm32 = A32ExpandImm(imm12);
```

### T1



#### T1 variant

```
CMP{<c>}{<q>} <Rn>, #<imm8>
```

#### Decode for this encoding

```
n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
```

### T2

#### T2 variant

```
CMP{<c>}.W <Rn>, #<const> // <Rd>, <const> can be represented in T1
CMP{<c>}{<q>} <Rn>, #<const>
```

#### Decode for this encoding

```
n = UInt(Rn);  imm32 = T32ExpandImm(i:imm3:imm8);
if n == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is a general-purpose source register, encoded in the "Rn" field.

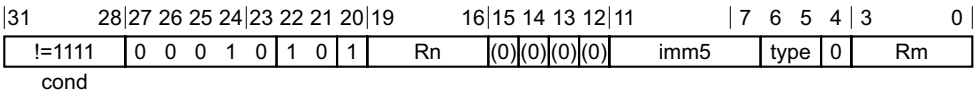
For encoding T2: is the general-purpose source register, encoded in the "Rn" field.

<imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.37 CMP (register)

Compare (register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

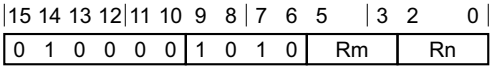
### A1

#### *Rotate right with extend variant*

Applies when `imm5 = 00000 && type = 11`.

```
CMP{<c>}{<q>} <Rn>, <Rm>, RRX
```

#### *Shift or rotate by value variant*



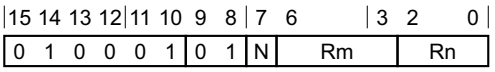
Applies when `!(imm5 == 00000 && type == 11)`.

```
CMP{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

### T1



#### *T1 variant*

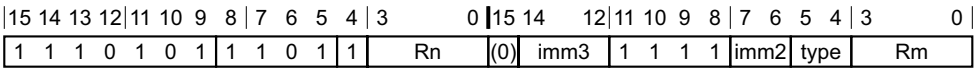
```
CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> both from R0-R7
```

#### *Decode for this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *T2 variant*



```
CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> not both from R0-R7
```

#### *Decode for this encoding*

```
n = UInt(N:Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
if n < 8 && m < 8 then UNPREDICTABLE;
if n == 15 || m == 15 then UNPREDICTABLE;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T3

#### *Rotate right with extend variant*

Applies when `imm3 = 000 && imm2 = 00 && type = 11`.

```
CMP{<c>}{<q>} <Rn>, <Rm>, RRX
```

#### *Shift or rotate by value variant*

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

```
CMP{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1 or T2
CMP{<c>}{<q>} <Rn>, <Rm>, <shift> #<amount>
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *CMP (register)* on page K1-5434.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1 and T3: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "N:Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1, T2 and T3: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

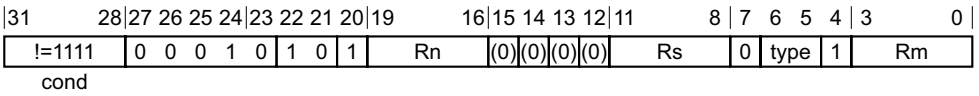
### Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.38 CMP (register-shifted register)

Compare (register-shifted register) subtracts a register-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

### A1

#### *A1 variant*

```
CMP{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```

## F6.1.39 CPS, CPSID, CPSIE

Change PE State changes one or more of the PSTATE.{A, I, F} interrupt mask bits and, optionally, the PSTATE.M mode field, without changing any other PSTATE bits.

CPS is treated as NOP if executed in User mode unless it is defined as being CONSTRAINED UNPREDICTABLE elsewhere in this section.

The PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-3771.

### A1

#### *CPS variant*

Applies when imod = 00 && M = 1.

```
CPS{<q>} #<mode> // Cannot be conditional
```

#### *CPSID variant*

Applies when imod = 11 && M = 0.

```
CPSID{<q>} <iflags> // Cannot be conditional
```

#### *CPSID variant*

Applies when imod = 11 && M = 1.

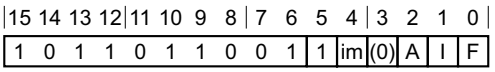
```
CPSID{<q>} <iflags> , #<mode> // Cannot be conditional
```

#### *CPSIE variant*

Applies when imod = 10 && M = 0.

```
CPSIE{<q>} <iflags> // Cannot be conditional
```

#### *CPSIE variant*



Applies when imod = 10 && M = 1.

```
CPSIE{<q>} <iflags> , #<mode> // Cannot be conditional
```

#### *Decode for all variants of this encoding*

```
if mode != '00000' && M == '0' then UNPREDICTABLE;
if (imod<1> == '1' && A:I:F == '000') || (imod<1> == '0' && A:I:F != '000') then UNPREDICTABLE;
enable = (imod == '10');  disable = (imod == '11');  changemode = (M == '1');
affectA = (A == '1');  affectI = (I == '1');  affectF = (F == '1');
if (imod == '00' && M == '0') || imod == '01' then UNPREDICTABLE;
```

### T1

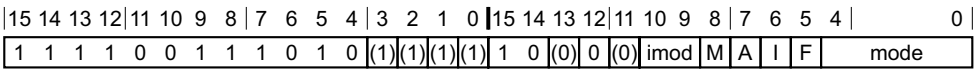
Non-Confidential - Beta

#### CPSID variant

Applies when im = 1.

```
CPSID{<q>} <iflags> // Not permitted in IT block
```

#### CPSIE variant



Applies when im = 0.

```
CPSIE{<q>} <iflags> // Not permitted in IT block
```

#### Decode for all variants of this encoding

```
if A:I:F == '000' then UNPREDICTABLE;
enable = (im == '0');  disable = (im == '1');  changemode = FALSE;
affectA = (A == '1');  affectI = (I == '1');  affectF = (F == '1');
if InITBlock() then UNPREDICTABLE;
```

### T2

#### CPS variant

Applies when imod = 00 && M = 1.

```
CPS{<q>} #<mode> // Not permitted in IT block
```

#### CPSID variant

Applies when imod = 11 && M = 0.

```
CPSID.W <iflags> // Not permitted in IT block
```

#### CPSID variant

Applies when imod = 11 && M = 1.

```
CPSID{<q>} <iflags>, #<mode> // Not permitted in IT block
```

#### CPSIE variant

Applies when imod = 10 && M = 0.

```
CPSIE.W <iflags> // Not permitted in IT block
```

#### CPSIE variant

Applies when imod = 10 && M = 1.

```
CPSIE{<q>} <iflags>, #<mode> // Not permitted in IT block
```

#### Decode for all variants of this encoding

```
if imod == '00' && M == '0' then SEE "Hint instructions";
if mode != '00000' && M == '0' then UNPREDICTABLE;
if (imod<1> == '1' && A:I:F == '000') || (imod<1> == '0' && A:I:F != '000') then UNPREDICTABLE;
enable = (imod == '10');  disable = (imod == '11');  changemode = (M == '1');
affectA = (A == '1');  affectI = (I == '1');  affectF = (F == '1');
if imod == '01' || InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

Hint instructions: In encoding T2, if the `imod` field is `00` and the `M` bit is `0`, a hint instruction is encoded. To determine which hint instruction, see *Branches and miscellaneous control* on page F3-2485.

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *CPS (T32)* on page K1-5479 and .

### Assembler symbols

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<iflags>` Is a sequence of one or more of the following, specifying which interrupt mask bits are affected:

- `a` Sets the A bit in the instruction, causing the specified effect on PSTATE.A, the asynchronous abort mask bit.
- `i` Sets the I bit in the instruction, causing the specified effect on PSTATE.I, the IRQ interrupt mask bit.
- `f` Sets the F bit in the instruction, causing the specified effect on PSTATE.F, the FIQ interrupt mask bit.

`<mode>` Is the number of the mode to change to, in the range 0 to 31, encoded in the "mode" field.

### Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';
            if affectI then PSTATE.I = '1';
            if affectF then PSTATE.F = '1';
        if changemode then
            // WriteMode will set PSTATE.IL if 'mode' is not legal.
            AArch32.WriteMode(mode);
else
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';
            if affectI then PSTATE.I = '1';
            if affectF then PSTATE.F = '1';
        if changemode then
            // WriteMode will set PSTATE.IL if 'mode' is not legal.
            AArch32.WriteMode(mode);
```

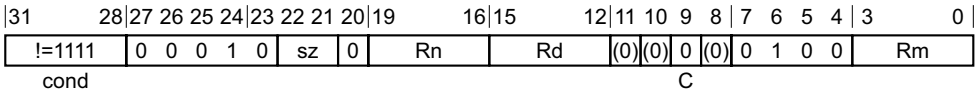
## F6.1.40 CRC32



CRC32 performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

**Note**

ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

### A1

#### *CRC32B variant*

Applies when sz = 00.

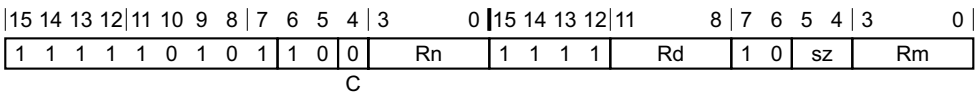
```
CRC32B{<q>} <Rd>, <Rn>, <Rm>
```

#### *CRC32H variant*

Applies when sz = 01.

```
CRC32H{<q>} <Rd>, <Rn>, <Rm>
```

#### *CRC32W variant*



Applies when sz = 10.

```
CRC32W{<q>} <Rd>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
```

### T1

#### *CRC32B variant*

Applies when sz = 00.

```
CRC32B{<q>} <Rd>, <Rn>, <Rm>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

#### *CRC32H variant*

Applies when sz = 01.

```
CRC32H{<q>} <Rd>, <Rn>, <Rm>
```

#### *CRC32W variant*

Applies when sz = 10.

```
CRC32W{<q>} <Rd>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *CRC32, CRC32C* on page K1-5434.

### Assembler symbols

| | |
|---|---|
| <q> | See *Standard assembler syntax fields* on page F2-2446. An CRC32 instruction must be unconditional. |
| <Rd> | Is the general-purpose accumulator output register, encoded in the "Rd" field. |
| <Rn> | Is the general-purpose accumulator input register, encoded in the "Rn" field. |
| <Rm> | Is the general-purpose data source register, encoded in the "Rm" field. |

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    acc = R[n];             // accumulator
    val = R[m]<size-1:0>;   // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

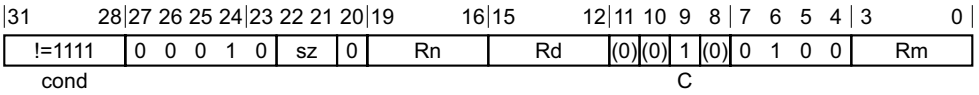
## F6.1.41 CRC32C



CRC32C performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction.

**Note**

ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

### A1

#### *CRC32CB variant*

Applies when sz = 00.

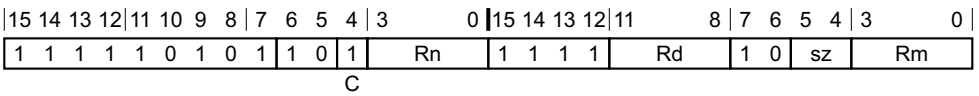
```
CRC32CB{<q>} <Rd>, <Rn>, <Rm>
```

#### *CRC32CH variant*

Applies when sz = 01.

```
CRC32CH{<q>} <Rd>, <Rn>, <Rm>
```

#### *CRC32CW variant*



Applies when sz = 10.

```
CRC32CW{<q>} <Rd>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
```

### T1

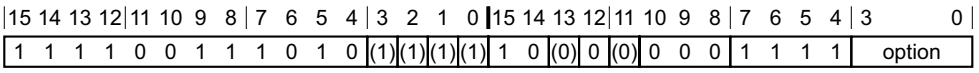
## F6.1.42 DBG

Debug Hint provides a hint to debug and related systems. See the system documentation for what use (if any) is made of this instruction.

### A1



#### *A1 variant*

```
DBG{<c>}{<q>} #<option>
```

#### *Decode for this encoding*

```
// Any decoding of 'option' is specified by the debug system
```

### T1

#### *T1 variant*

```
DBG{<c>}{<q>} #<option>
```

#### *Decode for this encoding*

```
// Any decoding of 'option' is specified by the debug system
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<option> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "option" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Hint_Debug(option);
```

Non-Confidential - Beta

## F6.1.43 DCPS1, DCPS2, DCPS3

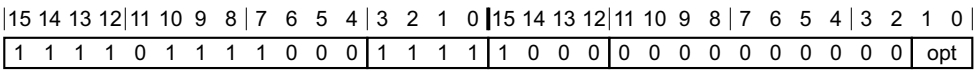
Debug Change PE State allows the debugger to move the PE into a higher Exception Level or to a specific mode at the current Exception Level.

These instructions are always UNDEFINED in Non-debug state.

`DCPS1` targets EL1 and:

- If EL1 is using AArch32, the PE enters SVC mode. If EL3 is using AArch32, Secure SVC is an EL3 mode. This means `DCPS1` causes the PE to enter EL3.
- If EL1 is using AArch64, the PE enters EL1h, and executes future instructions as A64 instructions.

`DCPS2` targets EL2 and:



- If EL2 is using AArch32, the PE enters Hyp mode.
- If EL2 is using AArch64, the PE enters EL2h, and executes future instructions as A64 instructions.

`DCPS3` targets EL3 and:

- If EL3 is using AArch32, the PE enters Monitor mode.
- If EL3 is using AArch64, the PE enters EL3h, and executes future instructions as A64 instructions.

For more information on the operation of these instructions, see DCPS.

### T1

#### *DCPS1 variant*

Applies when `opt = 01`.

`DCPS1`

#### *DCPS2 variant*

Applies when `opt = 10`.

`DCPS2`

#### *DCPS3 variant*

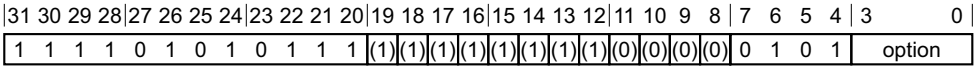
Applies when `opt = 11`.

`DCPS3`

#### *Decode for all variants of this encoding*

```
if !Halted() || opt == '00' then UNDEFINED;
```

### Operation



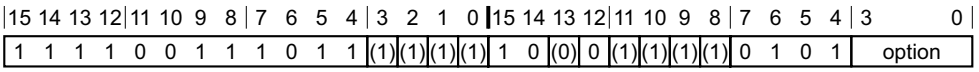
```
DCPSInstruction(opt);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.44 DMB

Data Memory Barrier is a memory barrier that ensures the ordering of observations of memory accesses, see .

### A1



#### *A1 variant*

```
DMB{<c>}{<q>} {<option>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1

#### *T1 variant*

```
DMB{<c>}{<q>} {<option>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2446. Must be AL or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<option> Specifies an optional limitation on the barrier operation. Values are:

- SY — Full system is the required shareability domain, reads and writes are the required access types in both and . Can be omitted. This option is referred to as the full system DMB. Encoded as option = 0b1111.
- ST — Full system is the required shareability domain, writes are the required access type in both and . SYST is a synonym for ST. Encoded as option = 0b1110.
- LD — Full system is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b1101.
- ISH — Inner Shareable is the required shareability domain, reads and writes are the required access types in both and . Encoded as option = 0b1011.
- ISHST — Inner Shareable is the required shareability domain, writes are the required access type in both and . Encoded as option = 0b1010.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

ISHLD — Inner Shareable is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b1001.

NSH — Non-shareable is the required shareability domain, reads and writes are the required access types in both  and . Encoded as option = 0b0111.

NSHST — Non-shareable is the required shareability domain, writes are the required access type in both  and . Encoded as option = 0b0110.

NSHLD — Non-shareable is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b0101.

OSH — Outer Shareable is the required shareability domain, reads and writes are the required access types in both  and . Encoded as option = 0b0011.

OSHST — Outer Shareable is the required shareability domain, writes are the required access type in both  and . Encoded as option = 0b0010.

OSHLD — Outer Shareable is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b0001.

All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system barrier operation, but software must not rely on this behavior.

**Note**

The instruction supports the following alternative <option> values, but ARM recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST is an alias for NSHST.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    case option of
        when '0001'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_Reads;
        when '0010'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_Writes;
        when '0011'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_All;
        when '0101'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_Reads;
        when '0110'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_Writes;
        when '0111'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_All;
        when '1001'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_Reads;
        when '1010'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_Writes;
        when '1011'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_All;
        when '1101'  domain = MBReqDomain_FullSystem;      types = MBReqTypes_Reads;
        when '1110'  domain = MBReqDomain_FullSystem;      types = MBReqTypes_Writes;
        otherwise    domain = MBReqDomain_FullSystem;      types = MBReqTypes_All;

    if HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1} then
        if HCR.BSU == '11' then
            domain = MBReqDomain_FullSystem;
        if HCR.BSU == '10' && domain != MBReqDomain_FullSystem then
            domain = MBReqDomain_OuterShareable;
        if HCR.BSU == '01' && domain == MBReqDomain_Nonshareable then
            domain = MBReqDomain_InnerShareable;

    DataMemoryBarrier(domain, types);

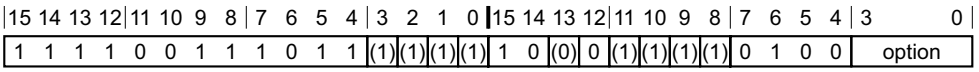
## F6.1.45 DSB

Data Synchronization Barrier is a memory barrier that ensures the completion of memory accesses, see .

### A1



#### *A1 variant*

```
DSB{<c>}{<q>} {<option>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1

#### *T1 variant*

```
DSB{<c>}{<q>} {<option>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2446. Must be AL or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<option> Specifies an optional limitation on the barrier operation. Values are:

- SY — Full system is the required shareability domain, reads and writes are the required access types in both and . Can be omitted. This option is referred to as the full system DMB. Encoded as option = 0b1111.
- ST — Full system is the required shareability domain, writes are the required access type in both and . SYST is a synonym for ST. Encoded as option = 0b1110.
- LD — Full system is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b1101.
- ISH — Inner Shareable is the required shareability domain, reads and writes are the required access types in both and . Encoded as option = 0b1011.
- ISHST — Inner Shareable is the required shareability domain, writes are the required access type in both and . Encoded as option = 0b1010.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

ISHLD — Inner Shareable is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b1001.

NSH — Non-shareable is the required shareability domain, reads and writes are the required access types in both  and . Encoded as option = 0b0111.

NSHST — Non-shareable is the required shareability domain, writes are the required access type in both  and . Encoded as option = 0b0110.

NSHLD — Non-shareable is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b0101.

OSH — Outer Shareable is the required shareability domain, reads and writes are the required access types in both  and . Encoded as option = 0b0011.

OSHST — Outer Shareable is the required shareability domain, writes are the required access type in both  and . Encoded as option = 0b0010.

OSHLD — Outer Shareable is the required shareability domain, reads are the required access type in , and reads and writes are the required access types in . Encoded as option = 0b0001.

All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system barrier operation, but software must not rely on this behavior.

**Note**

The instruction supports the following alternative <option> values, but ARM recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST is an alias for NSHST.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    case option of
        when '0001'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_Reads;
        when '0010'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_Writes;
        when '0011'  domain = MBReqDomain_OuterShareable;  types = MBReqTypes_All;
        when '0101'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_Reads;
        when '0110'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_Writes;
        when '0111'  domain = MBReqDomain_Nonshareable;    types = MBReqTypes_All;
        when '1001'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_Reads;
        when '1010'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_Writes;
        when '1011'  domain = MBReqDomain_InnerShareable;  types = MBReqTypes_All;
        when '1101'  domain = MBReqDomain_FullSystem;      types = MBReqTypes_Reads;
        when '1110'  domain = MBReqDomain_FullSystem;      types = MBReqTypes_Writes;
        otherwise    domain = MBReqDomain_FullSystem;      types = MBReqTypes_All;

    if HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1}  then
        if HCR.BSU == '11' then
            domain = MBReqDomain_FullSystem;
        if HCR.BSU == '10' && domain != MBReqDomain_FullSystem then
            domain = MBReqDomain_OuterShareable;
        if HCR.BSU == '01' && domain == MBReqDomain_Nonshareable then
            domain = MBReqDomain_InnerShareable;

    DataSynchronizationBarrier(domain, types);
```

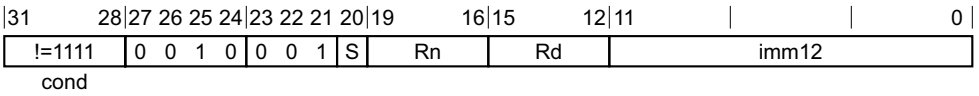
## F6.1.46 EOR, EORS (immediate)



Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

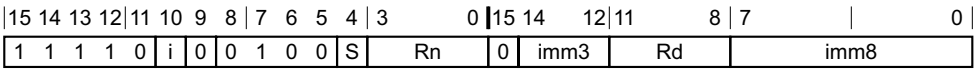
### A1

#### *EOR variant*

Applies when S = 0.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *EORS variant*



Applies when S = 1.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

### T1

#### *EOR variant*

Applies when S = 0.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *EORS variant*

Applies when S = 1 && Rd != 1111.

Non-Confidential - Beta

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TEQ (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] EOR imm32;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

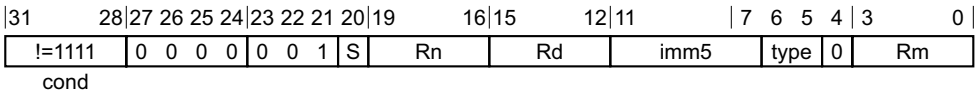
## F6.1.47 EOR, EORS (register)



Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### A1

#### *EOR, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *EOR, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

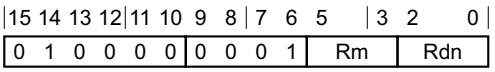
#### *EORS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *EORS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```

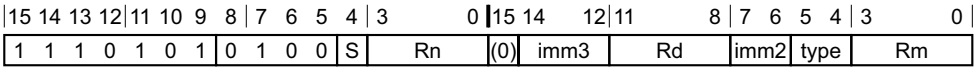
### T1



#### *T1 variant*

```
EOR<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
EORS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *EOR, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *EOR, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
EOR<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *EORS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && Rd != 1111 && imm2 = 00 && type = 11`.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *EORS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
EORS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE TEQ (register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

Non-Confidential - Beta

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdn>` Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

`LSL` when `type = 00`

`LSR` when `type = 01`

`ASR` when `type = 10`

`ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

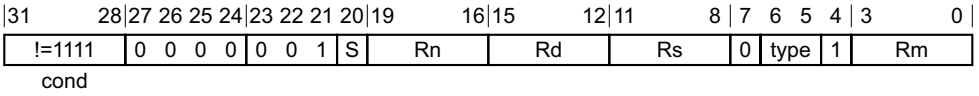
- Outside an IT block, if `EORS <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `EORS <Rd>, <Rn>` had been written
- Inside an IT block, if `EOR<c> <Rd>, <Rn>, <Rd>` has `<Rd>` and `<Rn>` both in the range R0-R7, it is assembled using encoding T1 as though `EOR<c> <Rd>, <Rn>` had been written.

To prevent either of these happening, use the `.W` qualifier.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



```
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F6.1.48 EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Not flag setting variant*

Applies when `S = 0`.

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

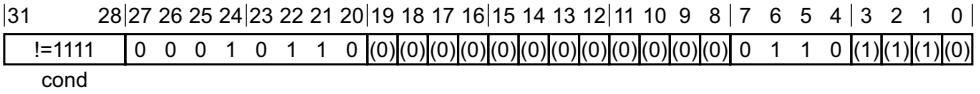
## F6.1.49 ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores PSTATE from SPSR_<current_mode>.

The register holding the preferred return address is:



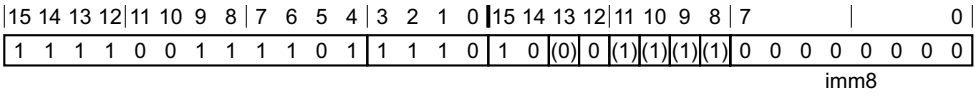
- ELR_hyp, when executing in Hyp mode.
- LR, when executing in a mode other than Hyp mode, User mode, or System mode.

The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.

Exception Return is CONSTRAINED UNPREDICTABLE in User mode and System mode.

In Debug state, the T1 encoding of ERET is decoded as DRPS.

### A1



#### *A1 variant*

```
ERET{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1

#### *T1 variant*

```
ERET{<c>}{<q>}
```

#### *Decode for this encoding*

```
if imm8 != '00000000' then SEE SUBS PC, LR and related instructions;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

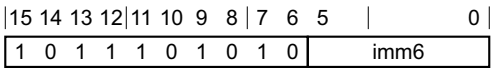
## F6.1.50 HLT

Halting breakpoint causes a software breakpoint to occur.

Halting breakpoint is always unconditional, even inside an IT block.

### A1



#### *A1 variant*

```
HLT{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UNDEFINED;
if cond != '1110' then UNPREDICTABLE; // HLT must be encoded with AL condition
// imm12:imm4 are for assembly/disassembly only and ignored by hardware
```

### T1

#### *T1 variant*

```
HLT{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UNDEFINED;
// imm6 is for assembly/disassembly only and ignored by hardware
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *HLT* on page K1-5435.

## Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-2446. An HLT instruction must be unconditional.

<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

For encoding T1: is a 6-bit unsigned immediate, in the range 0 to 63, encoded in the "imm6" field. This value is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

## Operation for all encodings

```
EncodingSpecificOperations();
Halt(DebugHalt_HaltInstruction);
```

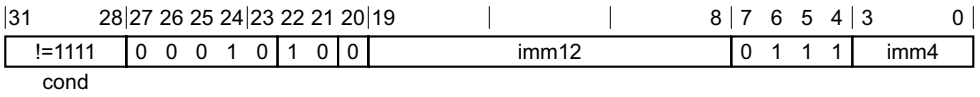
Non-Confidential - Beta

### F6.1.51 HVC



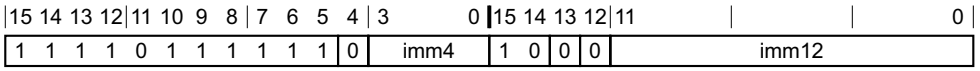
Hypervisor Call causes a Hypervisor Call exception. For more information see . Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is:

- UNDEFINED in Secure state, and in User mode in Non-secure state.
- When SCR.HCE is set to 0, UNDEFINED in Non-secure EL1 modes and CONSTRAINED UNPREDICTABLE in Hyp mode.

On executing an HVC instruction, the HSR reports the exception as a Hypervisor Call exception, using the EC value 0x12, and captures the value of the immediate argument, see *Use of the HSR* on page G4-4105.

#### A1



##### *A1 variant*

```
HVC{<q>} {#}<imm16>
```

##### *Decode for this encoding*

```
if cond != '1110' then UNPREDICTABLE;
imm16 = imm12:imm4;
// imm16 is for assembly/disassembly. It is reported in the HSR but otherwise is ignored by
// hardware. An HVC handler might interpret imm16, for example to determine the required service.
```

#### T1

##### *T1 variant*

```
HVC{<q>} {#}<imm16>
```

##### *Decode for this encoding*

```
// imm16 is for assembly/disassembly. It is reported in the HSR but otherwise is ignored by
// hardware. An HVC handler might interpret imm16, for example to determine the required service.
imm16 = imm4:imm12;
if InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and in particular, .

### Assembler symbols

<q> See *Standard assembler syntax fields* on page F2-2446. An HVC instruction must be unconditional.

<imm16> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.

### Operation for all encodings

```
EncodingSpecificOperations();
if !HaveEL(EL2) || PSTATE.EL == EL0 || IsSecure() then
    UNDEFINED;

hvc_enable = if HaveEL(EL3) then SCR_GEN[].HCE else NOT(HCR.HCD);
if hvc_enable == '0' then
    UNDEFINED;
else
    AArch32.CallHypervisor(imm16);
```

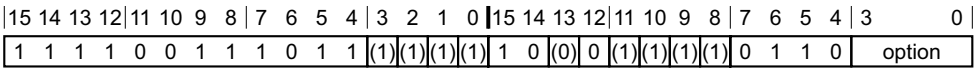
## F6.1.52 ISB

Instruction Synchronization Barrier flushes the pipeline in the PE, so that all instructions following the `ISB` are fetched from cache or memory, after the instruction has been completed. It ensures that the effects of context changing operations executed before the `ISB` instruction are visible to the instructions fetched after the `ISB`. Context changing operations include changing the Address Space Identifier (ASID), TLB maintenance instructions, branch predictor maintenance operations, and all changes to the System registers.

In addition, any branches that appear in program order after the `ISB` instruction are written into the branch prediction logic with the context that is visible after the `ISB` instruction. This is needed to ensure correct execution of the instruction stream.

For more information, see *Instruction Synchronization Barrier (ISB)* on page E2-2375.

### A1



#### *A1 variant*

```
ISB{<c>}{<q>} {<option>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1

#### *T1 variant*

```
ISB{<c>}{<q>} {<option>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-2446. Must be `AL` or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<option>` Specifies an optional limitation on the barrier operation. Values are:

`SY` Full system barrier operation, encoded as option = `0b1111`. Can be omitted.

All other encodings of option are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

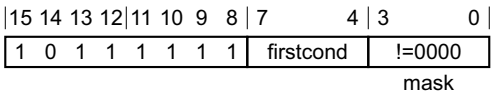
## F6.1.53 IT

If-Then makes up to four following instructions (the IT block) conditional. The conditions for the instructions in the IT block are the same as, or the inverse of, the condition the IT instruction specifies for the first instruction in the block.



The IT instruction itself does not affect the condition flags, but the execution of the instructions in the IT block can change the condition flags.

16-bit instructions in the IT block, other than CMP, CMN and TST, do not set the condition flags. An IT instruction with the AL condition can change the behavior without conditional execution.

The architecture permits exception return to an instruction in the IT block only if the restoration of the CPSR restores ITSTATE to a state consistent with the conditions specified by the IT instruction. Any other exception return to an instruction in an IT block is UNPREDICTABLE. Any branch to a target instruction in an IT block is not permitted, and if such a branch is made it is UNPREDICTABLE what condition is used when executing that target instruction and any subsequent instruction in the IT block.

See also *Conditional instructions* on page F1-2409 and *Conditional execution* on page F2-2447.

### T1

#### *T1 variant*

```
IT{<x>{<y>{<z>}}}{<q>} <cond>
```

#### *Decode for this encoding*

```
if mask == '0000' then SEE "Related encodings";
if firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1) then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *IT* on page K1-5435.

Related encodings: *Miscellaneous 16-bit instructions* on page F3-2471.

### Assembler symbols

<x> The condition for the second instruction in the IT block. If omitted, the "mask" field is set to 0b1000. If present it is encoded in the "mask[3]" field:

- T — firstcond[0]
- E — NOT firstcond[0]

<y> The condition for the third instruction in the IT block. If omitted and <x> is present, the "mask[2:0]" field is set to 0b100. If <y> is present it is encoded in the "mask[2]" field:

- T — firstcond[0]
- E — NOT firstcond[0]

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<z> The condition for the fourth instruction in the IT block. If omitted and <y> is present, the "mask[1:0]" field is set to 0b10. If <z> is present, the "mask[0]" field is set to 1, and it is encoded in the "mask[1]" field:

T firstcond[0]

E NOT firstcond[0]

<q> See *Standard assembler syntax fields* on page F2-2446.

<cond> The condition for the first instruction in the IT block, encoded in the "firstcond" field. See  for the range of conditions available, and the encodings.

The conditions specified in an IT instruction must match those specified in the syntax of the instructions in its IT block. When assembling to A32 code, assemblers check IT instruction syntax for validity but do not generate assembled instructions for them. See *Conditional instructions* on page F1-2409.

## Operation

```
EncodingSpecificOperations();
AArch32.CheckITEnabled(mask);
PSTATE.IT<7:0> = firstcond:mask;
```

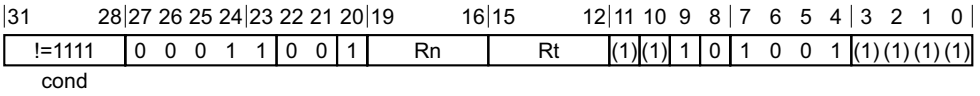
## F6.1.56 LDAEX



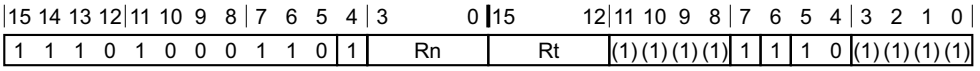
Load-Acquire Exclusive Word loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
LDAEX{<c>}{<q>} <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDAEX{<c>}{<q>} <Rt>, [<Rn>]
```

#### *Decode for this encoding*

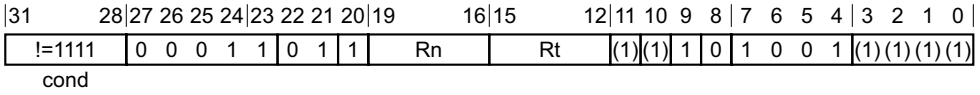
## F6.1.58 LDAEXD



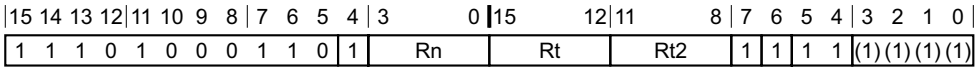
Load-Acquire Exclusive Doubleword loads a doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also acts as a barrier instruction with the ordering requirements described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
LDAEXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  t2 = t + 1;  n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDAEXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDAEXD* on page K1-5435.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt2> For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address, 8);
    value = MemO[address, 8];
    // Extract words from 64-bit loaded value such that R[t] is
    // loaded from address and R[t2] from address+4.
    R[t]  = if BigEndian() then value<63:32> else value<31:0>;
    R[t2] = if BigEndian() then value<31:0>  else value<63:32>;
```

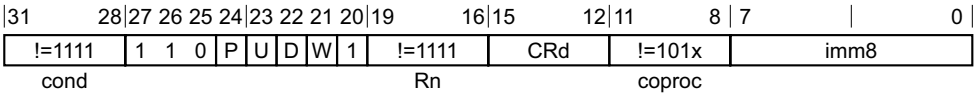
## F6.1.61 LDC, LDC2 (immediate)



Load Coprocessor (immediate) loads data from consecutive memory addresses to a conceptual coprocessor.

This is a generic coprocessor instruction. The `coproc` field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the `imm8`, `CRd`, and `D` field values that are valid `LDC` and `LDC2` instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

In an implementation that includes EL2, the permitted `LDC` access to a System register can be trapped to Hyp mode, meaning that an attempt to execute an `LDC` instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *Trapping general Non-secure System register accesses to debug registers* on page G1-3871.

For simplicity, the `LDC` pseudocode does not show this possible trap to Hyp mode.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

```
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>{, #{+/-}<imm>}]

if P == '0' && U == '0' && D == '1' && W == '0' then SEE MRRC, MRRC2;
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
n = UInt(Rn);  cp = UInt(coproc);
imm32 = ZeroExtend(imm8:'00', 32);  index = (P == '1');  add = (U == '1');  wback = (W == '1');
```

### T2

#### Offset variant

Applies when `P = 1 && W = 0`.

```
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>{, #{+/-}<imm>}]
```

#### Post-indexed variant

Applies when `P = 0 && W = 1`.

```
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>], #{+/-}<imm>
```

#### Pre-indexed variant

Applies when `P = 1 && W = 1`.

```
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>, #{+/-}<imm>]!
```

#### Unindexed variant

Applies when `P = 0 && U = 1 && W = 0`.

```
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>], <option>
```

#### Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDC (literal);
if P == '0' && U == '0' && D == '0' && W == '0' then UNDEFINED;
if P == '0' && U == '0' && D == '1' && W == '0' then SEE MRRC, MRRC2;
if coproc == '101x' then UNDEFINED;
n = UInt(Rn); cp = UInt(coproc);
imm32 = ZeroExtend(imm8:'00', 32);  index = (P == '1');  add = (U == '1');  wback = (W == '1');
```

## Notes for all encodings

Advanced SIMD and floating-point: Extension register load/store instructions.

## Assembler symbols

| | |
|---|---|
| `L` | If specified, selects the D == 1 form of the encoding. If omitted, selects the D == 0 form. |
| `<c>` | For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.<br>For encoding A2: see *Standard assembler syntax fields* on page F2-2446. `<c>` must be `AL` or omitted. |
| `<q>` | See *Standard assembler syntax fields* on page F2-2446. |
| `<coproc>` | Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<CRd> Is the coprocessor register to be transferred, encoded in the "CRd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see LDC, LDC2 (literal).

<option> Is a coprocessor option, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

<imm> Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    repeat
        Coproc_SendLoadedWord(MemA[address,4], cp, ThisInstr());
        address = address + 4;
    until Coproc_DoneLoading(cp, ThisInstr());
    if wback then R[n] = offset_addr;
```

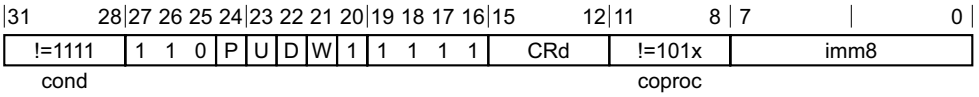
## F6.1.62 LDC, LDC2 (literal)



Load Coprocessor (literal) loads data from consecutive memory addresses to a conceptual coprocessor.

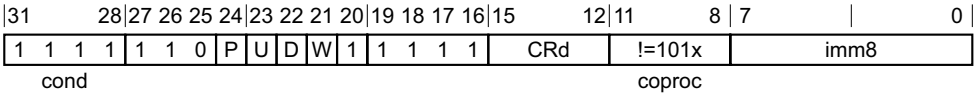
This is a generic coprocessor instruction. The `coproc` field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the `imm8`, `CRd`, and `D` field values that are valid `LDC` and `LDC2` instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

In an implementation that includes EL2, the permitted `LDC` access to a System register can be trapped to Hyp mode, meaning that an attempt to execute an `LDC` instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *Trapping general Non-secure System register accesses to debug registers* on page G1-3871.

For simplicity, the `LDC` pseudocode does not show this possible trap to Hyp mode.

### A1

#### A1 variant



Applies when `!(P == 0 && U == 0 && W == 0)`.

```
LDC{L}{<c>}{<q>} <coproc>, <CRd>, <label>
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [PC, #{+/-}<imm>]
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [PC], <option>
```

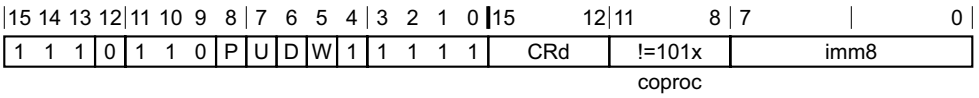
#### Decode for this encoding

```
if P == '0' && U == '0' && D == '0' && W == '0' then UNDEFINED;
if P == '0' && U == '0' && D == '1' && W == '0' then SEE MRRC, MRRC2;
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
index = (P == '1');  add = (U == '1');  cp = UInt(coproc);  imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

### A2

#### A2 variant

Applies when `!(P == 0 && U == 0 && W == 0)`.



```
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, <label>
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, [PC, #{+/-}<imm>]
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, [PC], <option>
```

#### Decode for this encoding

```
if P == '0' && U == '0' && D == '0' && W == '0' then UNDEFINED;
if P == '0' && U == '0' && D == '1' && W == '0' then SEE MRRC, MRRC2;
if coproc == '101x' then UNDEFINED;
index = (P == '1');  add = (U == '1');  cp = UInt(coproc);  imm32 = ZeroExtend(imm8:'00', 32);

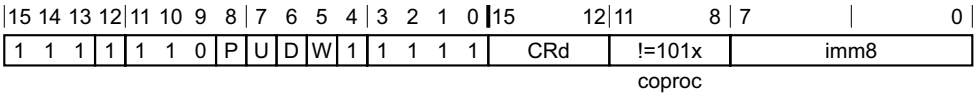
### T1

#### *T1 variant*



Applies when `!(P == 0 && U == 0 && W == 0)`.

```
LDC{L}{<c>}{<q>} <coproc>, <CRd>, <label>
LDC{L}{<c>}{<q>} <coproc>, <CRd>, [PC, #{+/-}<imm>]
```

#### *Decode for this encoding*

```
if P == '0' && U == '0' && D == '0' && W == '0' then UNDEFINED;
if P == '0' && U == '0' && D == '1' && W == '0' then SEE MRRC, MRRC2;
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
index = (P == '1');  add = (U == '1');  cp = UInt(coproc);  imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

### T2

#### *T2 variant*

Applies when `!(P == 0 && U == 0 && W == 0)`.

```
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, <label>
LDC2{L}{<c>}{<q>} <coproc>, <CRd>, [PC, #{+/-}<imm>]
```

#### *Decode for this encoding*

```
if P == '0' && U == '0' && D == '0' && W == '0' then UNDEFINED;
if P == '0' && U == '0' && D == '1' && W == '0' then SEE MRRC, MRRC2;
if coproc == '101x' then UNDEFINED;
index = (P == '1');  add = (U == '1');  cp = UInt(coproc);  imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDC/LDC2 (literal)* on page K1-5436.

Advanced SIMD and floating-point: Extension register load/store instructions.

## Assembler symbols

| | |
|---|---|
| `L` | If specified, selects the D == 1 form of the encoding. If omitted, selects the D == 0 form. |
| `<c>` | For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.<br>For encoding A2: see *Standard assembler syntax fields* on page F2-2446. `<c>` must be `AL` or omitted. |
| `<q>` | See *Standard assembler syntax fields* on page F2-2446. |
| `<coproc>` | Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<CRd>` Is the coprocessor register to be transferred, encoded in the "CRd" field.

`<option>` Is a coprocessor option, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field.

`<label>` The label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE` (encoded as U == 1). If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE (encoded as U == 0)`.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    offset_addr = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    address = if index then offset_addr else Align(PC,4);
    repeat
        Coproc_SendLoadedWord(MemA[address,4], cp, ThisInstr());
        address = address + 4;
    until Coproc_DoneLoading(cp, ThisInstr());
```

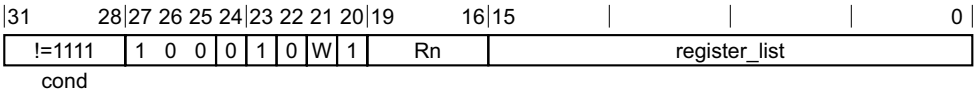
## F6.1.63 LDM, LDMIA, LDMFD

Load Multiple (Increment After, Full Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the highest of those locations can optionally be written back to the base register.



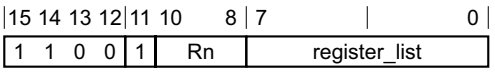
The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

Related system instructions are LDM (User registers) and LDM (exception return).

This instruction is used by the alias POP (multiple registers). See the *Alias conditions* on page F6-2712 table for details of when each alias is preferred.

### A1



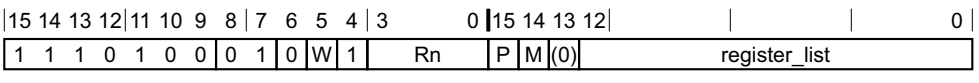
#### *A1 variant*

```
LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = '00000000':register_list;  wback = (registers<n> == '0');
if BitCount(registers) < 1 then UNPREDICTABLE;
```

### T2

### *T2 variant*

```
LDM{IA}{<c>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented
in T1
LDMFD{<c>}.W <Rn>{!}, <registers> // Alternate syntax, Full Descending stack, if <Rn>, '!' and
<registers> can be represented in T1
LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

### *Decode for this encoding*

```
n = UInt(Rn);  registers = P:M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDM/LDMIA/LDMFD (T32)* on page K1-5437 and .

## Alias conditions

| Alias | is preferred when |
|---|---|
| POP (multiple registers) | `W == '1' && Rn == '1101' && BitCount(register_list) > 1` |

## Assembler symbols

`IA` Is an optional suffix for the Increment After form.

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`!` For encoding A1 and T2: the address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

For encoding T1: the address adjusted by the size of the data loaded is written back to the base register. It is omitted if `<Rn>` is included in `<registers>`, otherwise it must be present.

`<registers>` For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field.

For encoding T2: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

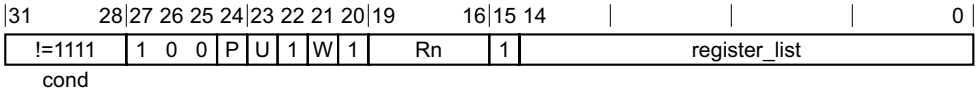
Non-Confidential - Beta

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4];  address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.64 LDM (exception return)



Load Multiple (exception return) loads multiple registers from consecutive memory locations using an address from a base register. The SPSR of the current mode is copied to the CPSR. An address adjusted by the size of the data loaded can optionally be written back to the base register.

The registers loaded include the PC. The word loaded for the PC is treated as an address and a branch occurs to that address.

Load Multiple (exception return) is:

- UNDEFINED in Hyp mode.
- UNPREDICTABLE in debug state, and in User mode and System mode.

### A1

#### *A1 variant*

```
LDM{<amode>}{<c>}{<q>} <Rn>{!}, <registers_with_pc>^
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;
wback = (W == '1');  increment = (U == '1');  wordhigher = (P == U);
if n == 15 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDM (exception return)* on page K1-5480.

### Assembler symbols

<amode> is one of:

| | |
|---|---|
| DA | Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0. |
| FA | Full Ascending. For this instruction, a synonym for DA. |
| DB | Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0. |
| EA | Empty Ascending. For this instruction, a synonym for DB. |
| IA | Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1. |
| FD | Full Descending. For this instruction, a synonym for IA. |
| IB | Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1. |
| ED | Empty Descending. For this instruction, a synonym for IB. |

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

Non-Confidential - Beta

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers_with_pc> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must be specified in the register list, and the instruction causes a branch to the address (data) loaded into the PC. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

Instructions with similar syntax but without the PC included in the registers list are described in LDM (User registers).

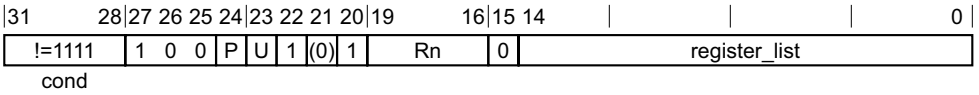
## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;                        // UNDEFINED or NOP
    else
        length = 4*BitCount(registers) + 4;
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;

        for i = 0 to 14
            if registers<i> == '1' then
                R[i] = MemA[address,4];  address = address + 4;
        new_pc_value = MemA[address,4];

        if wback && registers<n> == '0' then R[n] = if increment then R[n]+length else R[n]-length;
        if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;

        AArch32.ExceptionReturn(new_pc_value, SPSR[]);
```



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F6.1.65 LDM (User registers)

In an EL1 mode other than System mode, Load Multiple (User registers) loads multiple User mode registers from consecutive memory locations using an address from a base register. The registers loaded cannot include the PC. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Load Multiple (User registers) is UNDEFINED in Hyp mode, and UNPREDICTABLE in User and System modes.

#### A1

##### *A1 variant*

```
LDM{<amode>}{<c>}{<q>} <Rn>, <registers_without_pc>^
```

##### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  increment = (U == '1');  wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

#### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDM (User registers)* on page K1-5480.

#### Assembler symbols

<amode> is one of:

| | |
|---|---|
| DA | Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0. |
| FA | Full Ascending. For this instruction, a synonym for DA. |
| DB | Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0. |

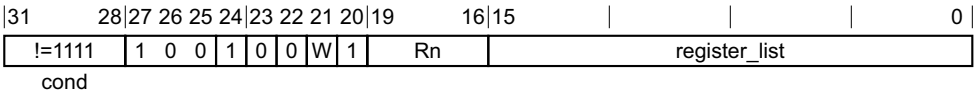
## F6.1.67 LDMDB, LDMEA



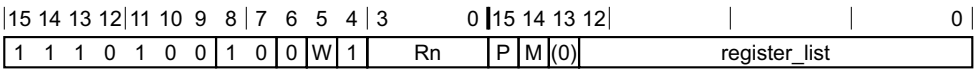
Load Multiple Decrement Before (Empty Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

Related system instructions are LDM (User registers) and LDM (exception return).

### A1



#### *A1 variant*

```
LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = P:M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDMDB/LDMEA* on page K1-5439.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers> For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4];  address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] - 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

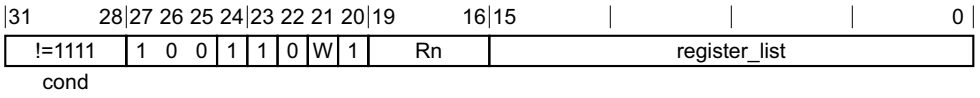
## F6.1.68 LDMIB, LDMED



Load Multiple Increment Before (Empty Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

Related system instructions are LDM (User registers) and LDM (exception return).

### A1

#### *A1 variant*

```
LDMIB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMED{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Descending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### Notes for all encodings

## F6.1.69 LDR (immediate)

Load Register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

This instruction is used by the alias POP (single register). See the *Alias conditions* on page F6-2726 table for details of when each alias is preferred.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

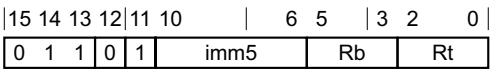
```
LDR{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

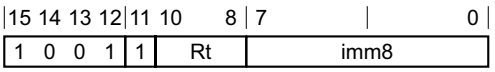
```
LDR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE LDR (literal);
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if wback && n == t then UNPREDICTABLE;
```

### T1

#### *T1 variant*



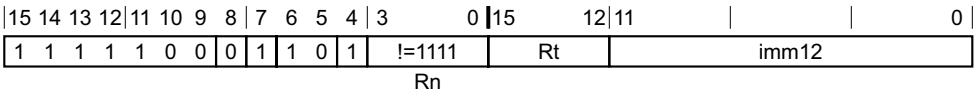
```
LDR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T2



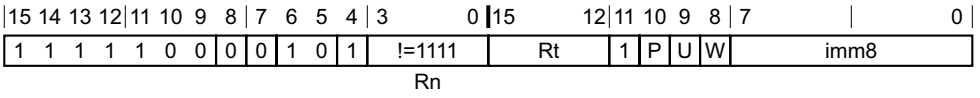
#### *T2 variant*

```
LDR{<c>}{<q>} <Rt>, [SP{, #{+}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = 13;  imm32 = ZeroExtend(imm8:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

### T3



#### *T3 variant*

```
LDR{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
LDR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE LDR (literal);
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32); index = TRUE;  add = TRUE;
wback = FALSE; if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### T4

#### *Offset variant*

Applies when `P = 1 && U = 0 && W = 0`.

```
LDR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 1`.

```
LDR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*

Applies when `P = 1 && W = 1`.

```
LDR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE LDR (literal);
if P == '1' && U == '1' && W == '0' then SEE LDRT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);
imm32 = ZeroExtend(imm8, 32); index = (P == '1');  add = (U == '1');  wback = (W == '1');
if (wback && n == t) || (t == 15 && InITBlock() && !LastInITBlock()) then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDR (immediate, T32)* on page K1-5440 and .

### Alias conditions

| Alias | of variant | is preferred when |
|---|---|---|
| POP (single register) | A1 (post-indexed) | `P == '0' && U == '1' && W == '0' && Rn == '1101' && imm12 == '000000000100'` |
| POP (single register) | T4 (post-indexed) | `Rn == '1101' && U == '1' && imm8 == '00000100'` |

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

`<Rn>` For encoding A1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDR (literal).

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

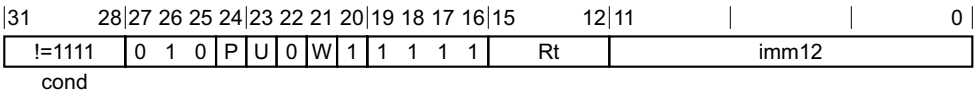
For encoding T1 and T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.

For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

### Operation for all encodings



```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,4];
        if wback then R[n] = offset_addr;
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,4];
        if wback then R[n] = offset_addr;
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
```

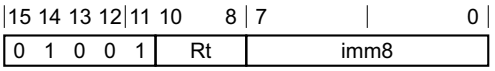
## F6.1.70 LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *A1 variant*



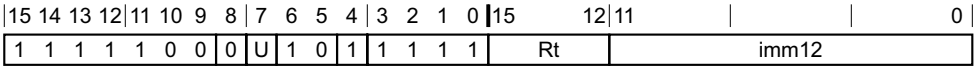
Applies when `!(P == 0 && W == 1)`.

```
LDR{<c>}{<q>} <Rt>, <label> // Normal form
LDR{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

#### *Decode for this encoding*

```
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if wback then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
LDR{<c>}{<q>} <Rt>, <label> // Normal form
```

#### *Decode for this encoding*

```
t = UInt(Rt);  imm32 = ZeroExtend(imm8:'00', 32);  add = TRUE;
```

### T2

#### *T2 variant*

```
LDR{<c>}.W <Rt>, <label> // Preferred syntax, and <Rt>, <label> can be represented in T1
LDR{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDR{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

#### *Decode for this encoding*

```
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDR (literal)* on page K1-5440.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The SP can be used. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

`<label>` For encoding A1 and T2: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are Multiples of four in the range 0 to 1020.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T2: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,4];
    if t == 15 then
        if address<1:0> == '00' then
            LoadWritePC(data);
        else
            UNPREDICTABLE;
    else
        R[t] = data;
```

## F6.1.71 LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see *Memory accesses* on page F2-2452.

The T32 form of LDR (register) does not support register writeback.

### A1

#### *Offset variant*

Applies when P = 1 && W = 0.

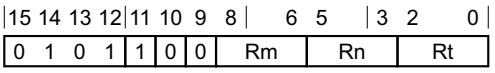
```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

#### *Post-indexed variant*

Applies when P = 0 && W = 0.

```
LDR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

#### *Pre-indexed variant*



Applies when P = 1 && W = 1.

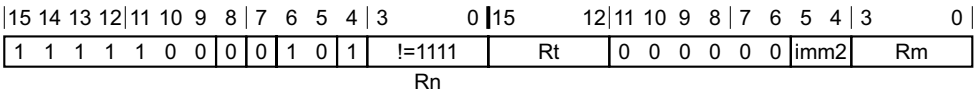
```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

#### *Decode for all variants of this encoding*

```
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

### T1

#### *T1 variant*



```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T2

#### *T2 variant*

```
LDR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE LDR (literal);
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDR (register, A32)* on page K1-5441.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This branch is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see .

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

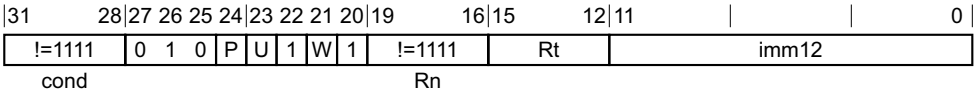
### Operation for all encodings



```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
        offset_addr = if add then (R[n] + offset) else (R[n] - offset);
        address = if index then offset_addr else R[n];
        data = MemU[address,4];
        if wback then R[n] = offset_addr;
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
        offset_addr = (R[n] + offset);
        address = offset_addr;
        data = MemU[address,4];
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
```

## F6.1.72 LDRB (immediate)

Load Register Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

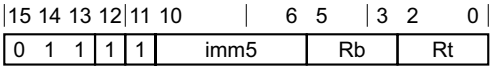
```
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



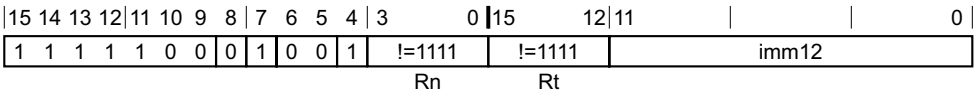
Applies when `P = 1 && W = 1`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE LDRB (literal);
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

### T1



#### *T1 variant*

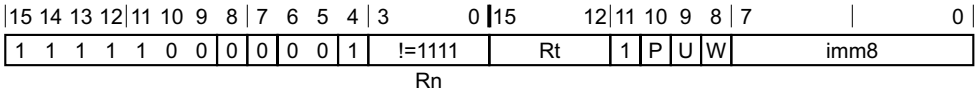
```
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

### T2

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



#### T2 variant

```
LDRB{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### Decode for this encoding

```
if Rt == '1111' then SEE PLD;
if Rn == '1111' then SEE LDRB (literal);
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### T3

#### Offset variant

Applies when `Rt != 1111 && P = 1 && U = 0 && W = 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

#### Post-indexed variant

Applies when `P = 0 && W = 1`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### Pre-indexed variant

Applies when `P = 1 && W = 1`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### Decode for all variants of this encoding

```
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE PLD, PLDW (immediate);
if Rn == '1111' then SEE LDRB (literal);
if P == '1' && U == '1' && W == '0' then SEE LDRBT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if  (t == 15 &&  W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRB (immediate, T32)* on page K1-5441 and .

## Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rt> | Is the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Rn> | For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRB (literal). |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

+ Specifies the offset is added to the base register.

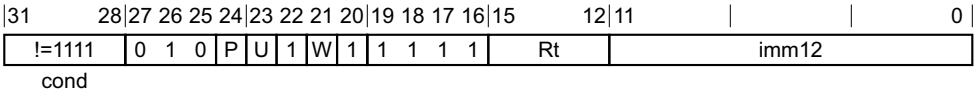
<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings



```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        R[t] = ZeroExtend(MemU[address,1], 32);
        if wback then R[n] = offset_addr;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        R[t] = ZeroExtend(MemU[address,1], 32);
        if wback then R[n] = offset_addr;
```

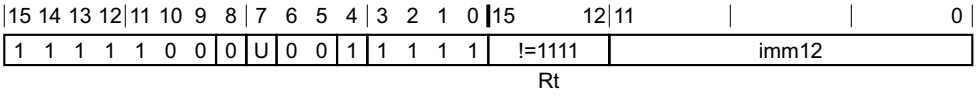
Non-Confidential - Beta

## F6.1.73 LDRB (literal)

Load Register Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *A1 variant*



Applies when `!(P == 0 && W == 1)`.

```
LDRB{<c>}{<q>} <Rt>, <label> // Normal form
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

#### *Decode for this encoding*

```
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDRB{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

#### *Decode for this encoding*

```
if Rt == '1111' then SEE PLD;
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRB (literal)* on page K1-5442.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<label>` The label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

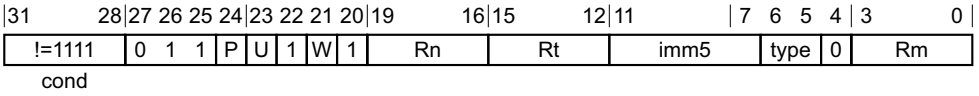
- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = ZeroExtend(MemU[address,1], 32);
```

## F6.1.74 LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

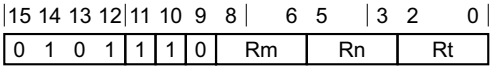
```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

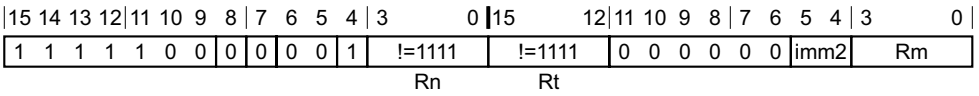
```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

#### *Decode for all variants of this encoding*

```
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

### T1

#### *T1 variant*



```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

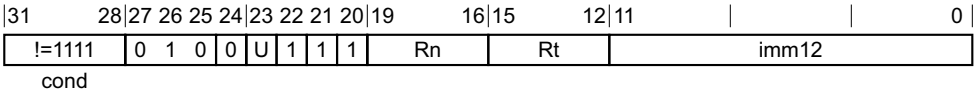
## F6.1.75 LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.



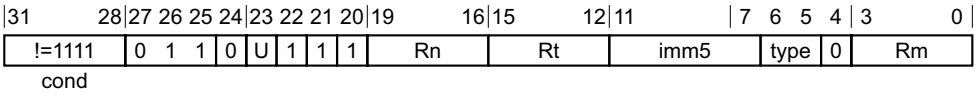
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

### A1



#### *A1 variant*

```
LDRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

#### *Decode for this encoding*

```

*Non-Confidential - Beta*

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

### *Decode for all variants of this encoding*

```
if P == '0' && W == '0' then SEE "Related encodings";
if Rn == '1111' then SEE LDRD (literal);
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRD (immediate)* on page K1-5443.

Related encodings: *Load/store dual, load/store exclusive, table branch* on page F3-2480.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRD (literal).

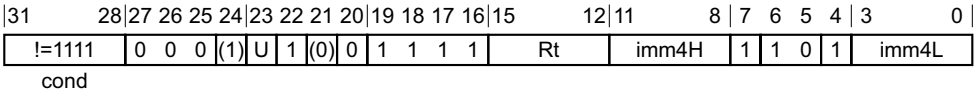
`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian()  then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
    if wback then R[n] = offset_addr;
```

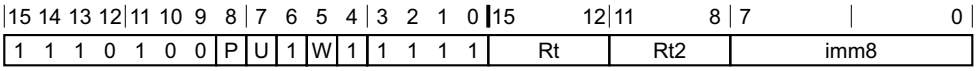
## F6.1.77 LDRD (literal)

Load Register Dual (literal) calculates an address from the PC value and an immediate offset, loads two words from memory, and writes them to two registers. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form
```

#### *Decode for this encoding*

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  imm32 = ZeroExtend(imm4H:imm4L, 32);  add = (U == '1');
if t2 == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

Applies when `!(P == 0 && W == 0)`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form
```

#### *Decode for this encoding*

```
if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt);  t2 = UInt(Rt2);
imm32 = ZeroExtend(imm8:'00', 32);  add = (U == '1');
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if W == '1' then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRD (literal)* on page K1-5444.

Related encodings: *Load/store dual, load/store exclusive, table branch* on page F3-2480.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<label>` For encoding A1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

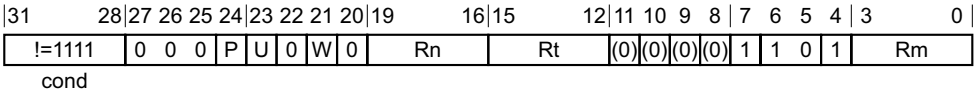
- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
```

## F6.1.78 LDRD (register)

Load Register Dual (register) calculates an address from a base register value and a register offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>
```

#### *Pre-indexed variant*

Applies when `P = 1 && W = 1`.

```
LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!
```

#### *Decode for all variants of this encoding*

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 || m == t || m == t2 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRD (register)* on page K1-5444.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

`<Rt2>` Is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];

    if wback then R[n] = offset_addr;
```

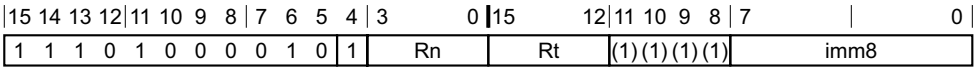
## F6.1.79 LDREX

Load Register Exclusive calculates an address from a base register value and an immediate offset, loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
LDREX{<c>}{<q>} <Rt>, [<Rn> {, {#}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = Zeros(32); // Zero offset
if t == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDREX{<c>}{<q>} <Rt>, [<Rn> {, #<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
if t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDREX* on page K1-5445.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rt> | Is the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Rn> | Is the general-purpose base register, encoded in the "Rn" field. |
| <imm> | For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    AArch32.SetExclusiveMonitors(address,4);
    R[t] = MemA[address,4];
```

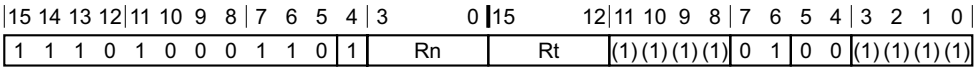
## F6.1.80 LDREXB

Load Register Exclusive Byte derives an address from a base register value, loads a byte from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
LDREXB{<c>}{<q>} <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDREXB{<c>}{<q>} <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDREXB* on page K1-5445.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Non-Confidential - Beta

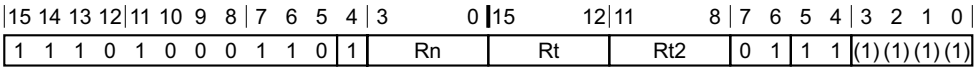
## F6.1.81 LDREXD

Load Register Exclusive Doubleword derives an address from a base register value, loads a 64-bit doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
LDREXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  t2 = t + 1;  n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDREXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDREXD* on page K1-5446.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt2> For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address,8);
    value = MemA[address,8];
    // Extract words from 64-bit loaded value such that R[t] is
    // loaded from address and R[t2] from address+4.
    R[t]  = if BigEndian() then value<63:32> else value<31:0>;
    R[t2] = if BigEndian() then value<31:0> else value<63:32>;
```

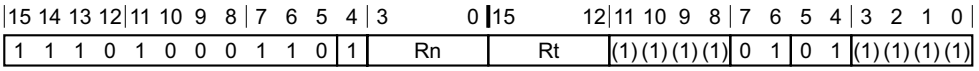
## F6.1.82 LDREXH

Load Register Exclusive Halfword derives an address from a base register value, loads a halfword from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
LDREXH{<c>}{<q>} <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDREXH{<c>}{<q>} <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDREXH* on page K1-5446.

### Assembler symbols

## F6.1.83 LDRH (immediate)

Load Register Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

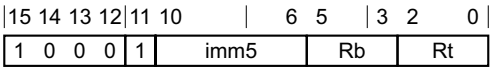
```
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



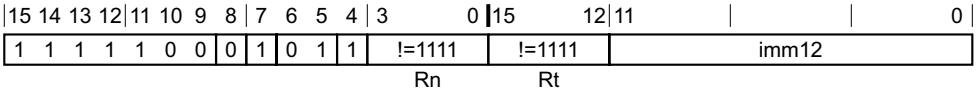
Applies when `P = 1 && W = 1`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE LDRH (literal);
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

### T1



#### *T1 variant*

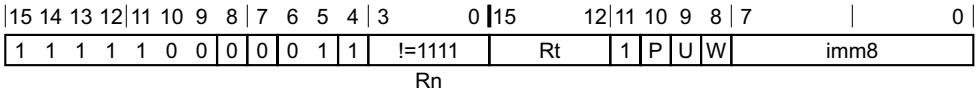
```
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'0', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

### T2

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



#### T2 variant

```
LDRH{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### Decode for this encoding

```
if Rt == '1111' then SEE PLD (immediate);
if Rn == '1111' then SEE LDRH (literal);
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### T3

#### Offset variant

Applies when `Rt != 1111 && P = 1 && U = 0 && W = 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

#### Post-indexed variant

Applies when `P = 0 && W = 1`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### Pre-indexed variant

Applies when `P = 1 && W = 1`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRH (literal);
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE PLDW (immediate);
if P == '1' && U == '1' && W == '0' then SEE LDRHT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRH (immediate, T32)* on page K1-5447 and .

## Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rt> | Is the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Rn> | For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRH (literal). |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

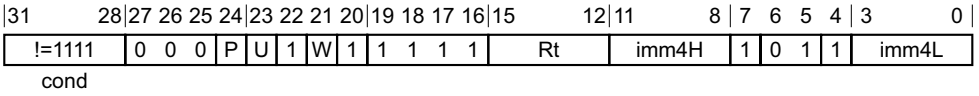
`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings



```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,2];
        if wback then R[n] = offset_addr;
        R[t] = ZeroExtend(data, 32);
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,2];
        if wback then R[n] = offset_addr;
        R[t] = ZeroExtend(data, 32);
```

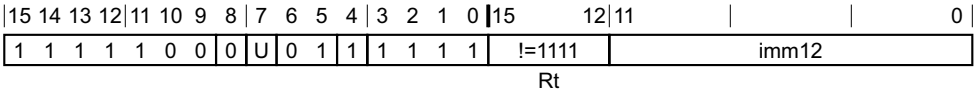
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.84 LDRH (literal)

Load Register Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *A1 variant*



Applies when `!(P == 0 && W == 1)`.

```
LDRH{<c>}{<q>} <Rt>, <label> // Normal form
LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

#### *Decode for this encoding*

```
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt);  imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDRH{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

#### *Decode for this encoding*

```
if Rt == '1111' then SEE PLD (literal);
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRH (literal)* on page K1-5447.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<label>` For encoding A1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

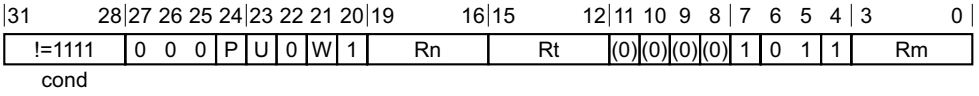
- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = ZeroExtend(data, 32);
```

*Non-Confidential - Beta*

## F6.1.85 LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

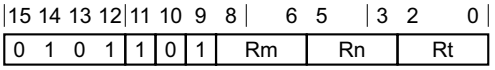
```
LDRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

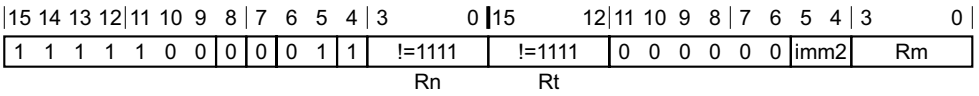
```
LDRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!
```

#### *Decode for all variants of this encoding*

```
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRType_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

### T1

#### *T1 variant*



```
LDRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

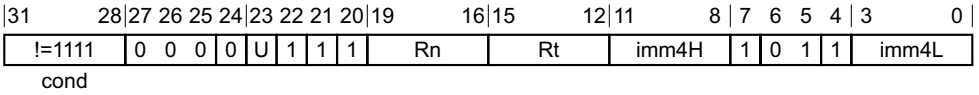
## F6.1.86 LDRHT

Load Register Halfword Unprivileged loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.



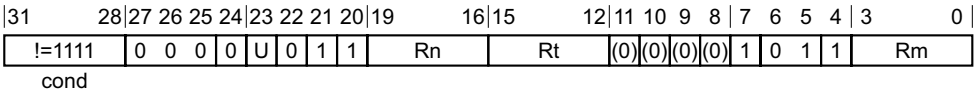
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1



#### *A1 variant*

```
LDRHT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

#### *Decode for this encoding*

```

### *Decode for this encoding*

```
if Rn == '1111' then SEE LDRH (literal);
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRHT* on page K1-5448.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

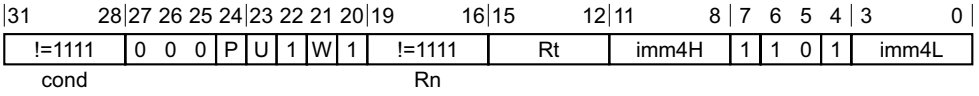
`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

## Operation for all encodings



```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,2];
    if postindex then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
```

## F6.1.87 LDRSB (immediate)

Load Register Signed Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

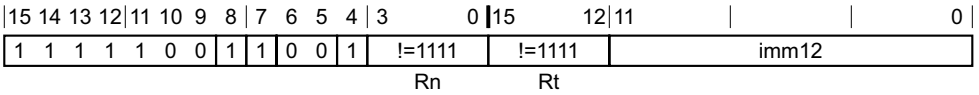
```
LDRSB{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

```
LDRSB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE LDRSB (literal);
if P == '0' && W == '1' then SEE LDRSBT;

### T2

#### *T2 variant*

```
LDRSB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
LDRSB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

#### *Decode for this encoding*

```
if Rt == '1111' then SEE PLI;
if Rn == '1111' then SEE LDRSB (literal);
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRSB (register)* on page K1-5449.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = SignExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
```

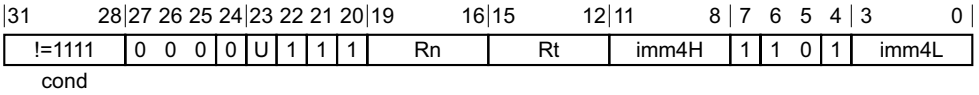
## F6.1.90 LDRSBT

Load Register Signed Byte Unprivileged loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.



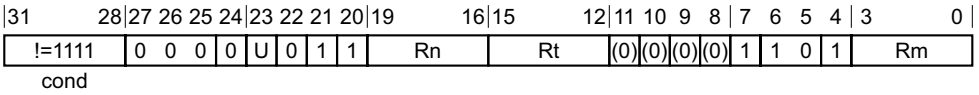
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1



#### *A1 variant*

```
LDRSBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

### A2

```
if Rn == '1111' then SEE LDRSB (literal);
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRSBT* on page K1-5449.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

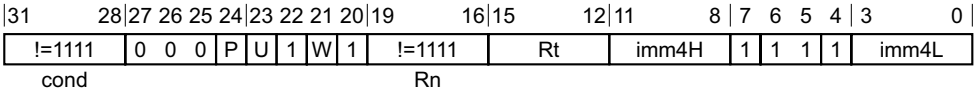
`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

## Operation for all encodings



```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = SignExtend(MemU_unpriv[address,1], 32);
    if postindex then R[n] = offset_addr;
```

## F6.1.91 LDRSH (immediate)

Load Register Signed Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

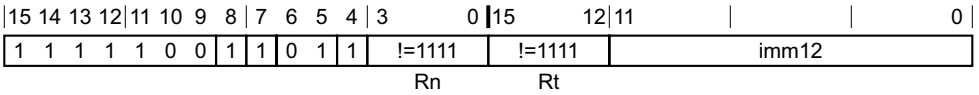
```
LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

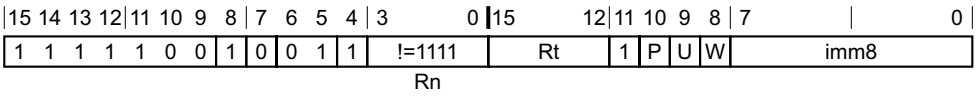
```
LDRSH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE LDRSH (literal);
if P == '0' && W == '1' then SEE LDRSHT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

### T1

#### *T1 variant*



```
LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE LDRSH (literal);
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
// ARMv8-A removes UNPREDICTABLE for R13
```

Non-Confidential - Beta

### T2

#### *Offset variant*

Applies when `P = 1 && U = 0 && W = 0`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 1`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*

Applies when `P = 1 && W = 1`.

```
LDRSH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE LDRSH (literal);
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE "Related instructions";
if P == '1' && U == '1' && W == '0' then SEE LDRSHT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRSH (immediate)* on page K1-5449.

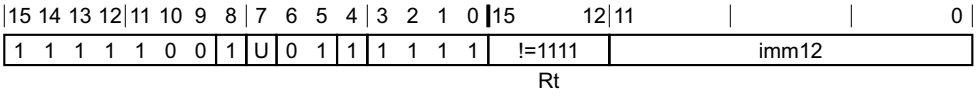
## F6.1.92 LDRSH (literal)

Load Register Signed Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *A1 variant*



Applies when `!(P == 0 && W == 1)`.

```
LDRSH{<c>}{<q>} <Rt>, <label> // Normal form
LDRSH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form
```

#### *Decode for this encoding*

```
if P == '0' && W == '1' then SEE LDRSHT;
t = UInt(Rt);  imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
LDRSH{<c>}{<q>} <Rt>, <label> // Preferred syntax
LDRSH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax
```

#### *Decode for this encoding*

```
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRSH (literal)* on page K1-5450.

Related instructions: *Load literal* on page F3-2497.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<label>` For encoding A1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into `<Rt>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add` == `TRUE`, encoded as U == 1. If the offset is negative, `imm32` is equal to minus the offset and `add` == `FALSE`, encoded as U == 0.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

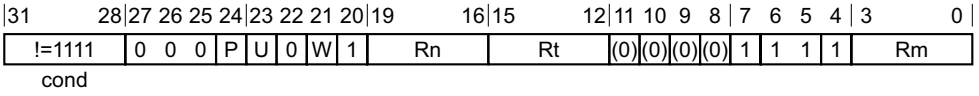
- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = SignExtend(data, 32);
```

index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *LDRSH (register)* on page K1-5450.

Related instructions: *Load/store (register offset)* on page F3-2469.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

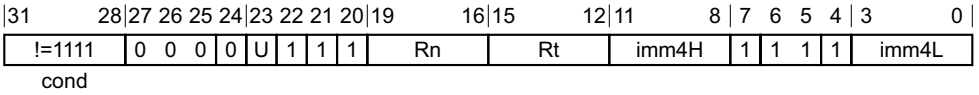
## F6.1.94 LDRSHT

Load Register Signed Halfword Unprivileged loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses* on page F2-2452.



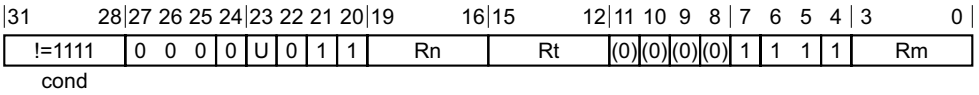
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1



#### *A1 variant*

## F6.1.96 LSL (immediate)

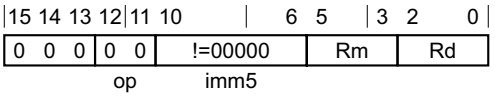
Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### A1

#### *MOV, shift or rotate by value variant*



```
LSL{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

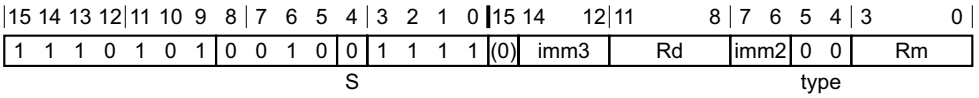
is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

### T2

#### *T2 variant*



```
LSL<c>{<q>} {<Rd>,} <Rm>, #<imm> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is the preferred disassembly when `InITBlock()`.

### T3

#### *MOV, shift or rotate by value variant*

```
LSL<c>.W {<Rd>,} <Rm>, #<imm> // Inside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

```
LSL{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 31, encoded in the "imm5" field.

For encoding T3: is the shift amount, in the range 1 to 31, encoded in the "imm3:imm2" field.

### Operation for all encodings

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

## F6.1.97 LSL (register)

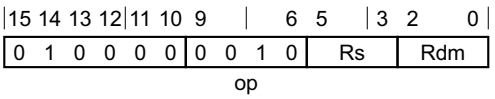
Logical Shift Left (register) shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

### A1

#### *Not flag setting variant*



```
LSL{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

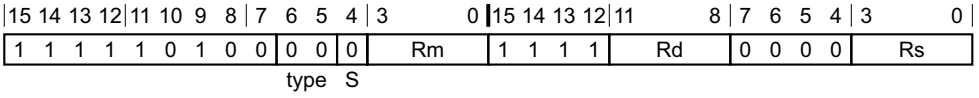
is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL <Rs>
```

and is always the preferred disassembly.

### T1

#### *Logical shift left variant*



```
LSL<c>{<q>} {<Rdm>,} <Rdm>, <Rs> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSL <Rs>
```

and is the preferred disassembly when `InITBlock()`.

### T2

#### *Not flag setting variant*

```
LSL<c>.W {<Rd>,} <Rm>, <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSL <Rs>
```

and is always the preferred disassembly.

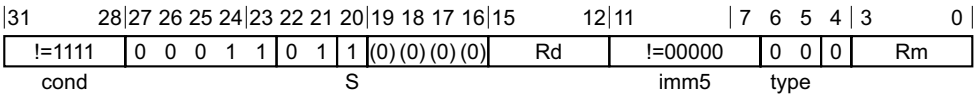
## F6.1.98 LSLS (immediate)

Logical Shift Left, setting flags (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.



The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

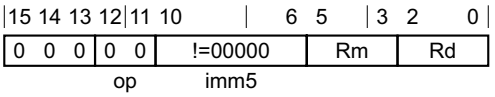
- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### A1

#### *MOVS, shift or rotate by value variant*



```
LSLS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

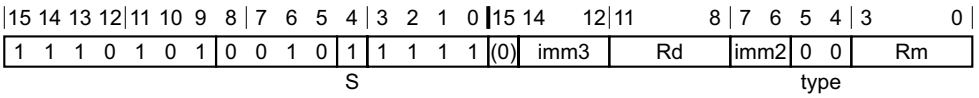
```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

### T2

#### *T2 variant*

```
LSLS{<q>} {<Rd>,} <Rm>, #<imm> // Outside IT block
```



is equivalent to

```
MOVS{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is the preferred disassembly when `!InITBlock()`.

Non-Confidential - Beta

### T3

#### *MOVS, shift or rotate by value variant*

```
LSLS.W {<Rd>,} <Rm>, #<imm> // Outside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

```
LSLS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSL #<imm>
```

and is always the preferred disassembly.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1 and T2: is the shift amount, in the range 1 to 31, encoded in the "imm5" field.

For encoding T3: is the shift amount, in the range 1 to 31, encoded in the "imm3:imm2" field.

## F6.1.100 LSR (immediate)

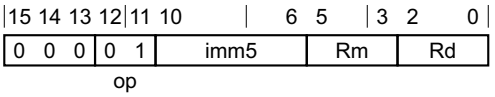
Logical Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### A1

#### *MOV, shift or rotate by value variant*



```
LSR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

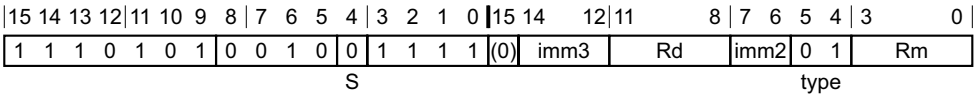
is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSR #<imm>
```

and is always the preferred disassembly.

### T2

#### *T2 variant*



```
LSR<c>{<q>} {<Rd>,} <Rm>, #<imm> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rd>, <Rm>, LSR #<imm>
```

and is the preferred disassembly when `InITBlock()`.

### T3

#### *MOV, shift or rotate by value variant*

```
LSR<c>.W {<Rd>,} <Rm>, #<imm> // Inside IT block, and <Rd>, <Rm>, <imm> can be represented in T2
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, LSR #<imm>
```

and is always the preferred disassembly.

```
LSR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

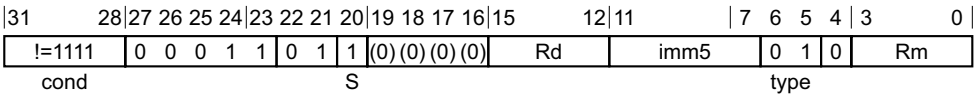
## F6.1.102 LSRS (immediate)

Logical Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.



The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

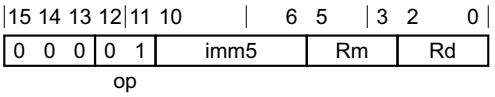
- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### A1

#### *MOVS, shift or rotate by value variant*



```
LSRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

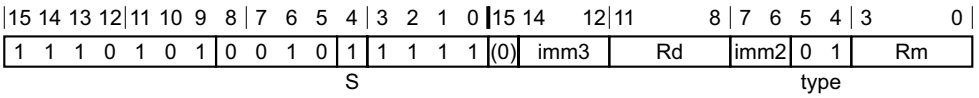
```
MOVS{<c>}{<q>} <Rd>, <Rm>, LSR #<imm>
```

and is always the preferred disassembly.

### T2

#### *T2 variant*

```
LSRS{<q>} {<Rd>,} <Rm>, #<imm> // Outside IT block
```



is equivalent to

```
MOVS{<q>} <Rd>, <Rm>, LSR #<imm>
```

and is the preferred disassembly when `!InITBlock()`.

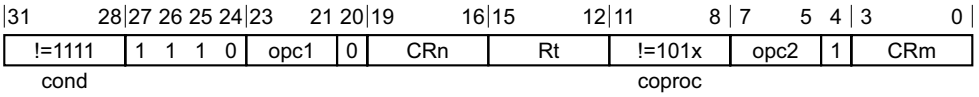
## F6.1.104 MCR, MCR2



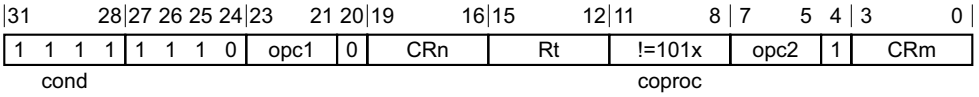
Move to Coprocessor from general-purpose register passes the value of a general-purpose register to a conceptual coprocessor.

This is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the opc1, opc2, CRn, and CRd field values that are valid MCR and MCR2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

In an implementation that includes EL2, MCR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see .

Because of the range of possible traps to Hyp mode, the MCR pseudocode does not show these possible traps.

### A1



#### *A1 variant*

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";

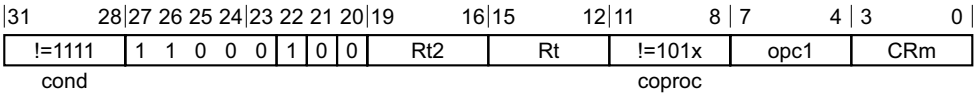
## F6.1.105 MCRR, MCRR2



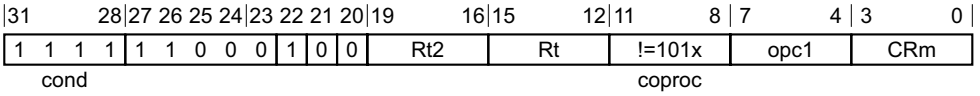
Move to Coprocessor from two general-purpose registers passes the values of two general-purpose registers to a conceptual coprocessor.

This is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the opc1, and CRm field values that are valid MCRR and MCRR2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

In an implementation that includes EL2, MCRR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCRR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see .

Because of the range of possible traps to Hyp mode, the MCRR pseudocode does not show these possible traps.

### A1



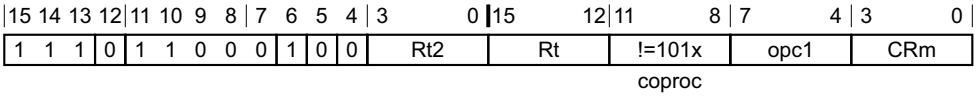
#### *A1 variant*

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### A2



#### *A2 variant*

```
MCRR2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

#### *Decode for this encoding*

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### T1

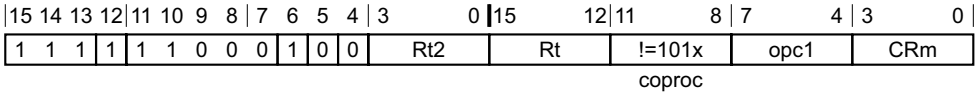
Non-Confidential - Beta



#### T1 variant

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

#### Decode for this encoding

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### T2

#### T2 variant

```
MCRR2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

#### Decode for this encoding

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

Advanced SIMD and floating-point: 64-bit transfers between ARM core and extension registers.

## Assembler symbols

| | |
|---|---|
| <c> | For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.<br>For encoding A2: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <coproc> | Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15. |
| <opc1> | Is a coprocessor-specific opcode in the range 0 to 15, encoded in the "opc1" field. |
| <Rt> | Is the first general-purpose register to be transferred, encoded in the "Rt" field. |
| <Rt2> | Is the second general-purpose register to be transferred, encoded in the "Rt2" field. |
| <CRm> | Is a coprocessor register, encoded in the "CRm" field. |

The relative significance of <Rt2> and <Rt> is IMPLEMENTATION DEFINED for IMPLEMENTATION DEFINED uses of the MCRR and MRRC instructions. For the architected uses, as described in this manual, <Rt2> transfers bits[63:32] of the selected coprocessor register, while <Rt> transfers bits[31:0].

## F6.1.106 MLA, MLAS

Multiply Accumulate multiplies two register values, and adds a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

In an A32 instruction, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

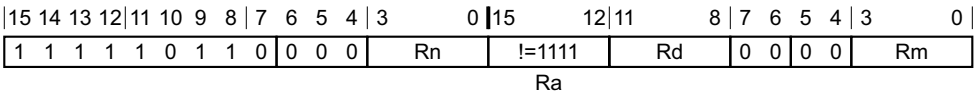
### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
MLAS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Not flag setting variant*



Applies when `S = 0`.

```
MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  setflags = (S == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for this encoding*

```
if Ra == '1111' then SEE MUL;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  setflags = FALSE;
if d == 15 || n == 15 || m  == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |

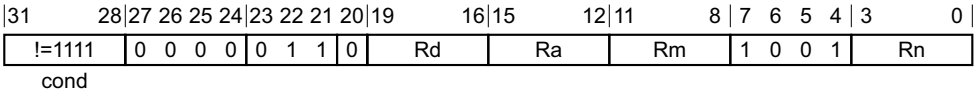
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Ra> Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]);  // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]);  // operand2 = UInt(R[m]) produces the same final results
    addend   = SInt(R[a]);  // addend   = UInt(R[a]) produces the same final results
    result = operand1 * operand2 + addend;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged
```

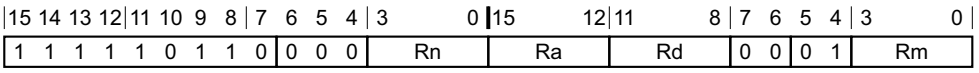
## F6.1.107 MLS

Multiply and Subtract multiplies two register values, and subtracts the product from a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

### A1



#### *A1 variant*

```
MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

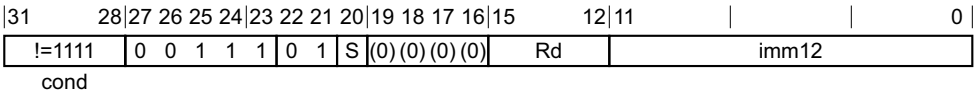
### F6.1.108 MOV, MOVS (immediate)



Move (immediate) writes an immediate value to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MOV variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

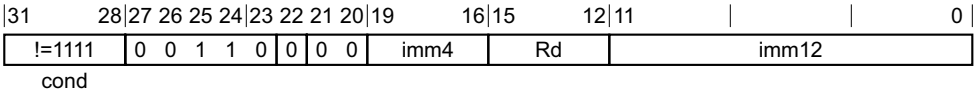
#### A1

##### *MOV variant*

Applies when S = 0.

```
MOV{<c>}{<q>} <Rd>, #<const>
```

##### *MOVS variant*



Applies when S = 1.

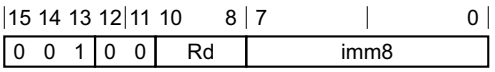
```
MOVS{<c>}{<q>} <Rd>, #<const>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  setflags = (S == '1');  (imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

#### A2

##### *A2 variant*



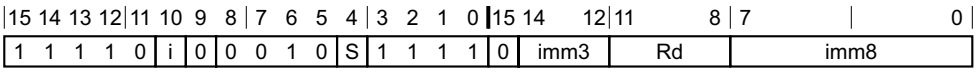
```
MOV{<c>}{<q>} <Rd>, #<imm16> // <imm16> can not be represented in A1
MOVW{<c>}{<q>} <Rd>, #<imm16> // <imm16> can be represented in A1
```

##### *Decode for this encoding*

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(imm4:imm12, 32);
if d == 15 then UNPREDICTABLE;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T1



#### *T1 variant*

```
MOV<c>{<q>} <Rd>, #<imm8> // Inside IT block
MOVS{<q>} <Rd>, #<imm8> // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rd);  setflags = !InITBlock();  imm32 = ZeroExtend(imm8, 32);  carry = PSTATE.C;
```

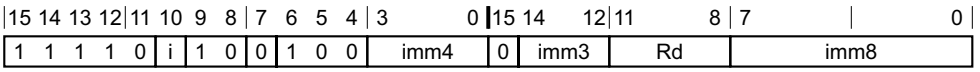
### T2

#### *MOV variant*

Applies when `S = 0`.

```
MOV<c>.W <Rd>, #<const> // Inside IT block, and <Rd>, <const> can be represented in T1
MOV{<c>}{<q>} <Rd>, #<const>
```

#### *MOVS variant*



Applies when `S = 1`.

```
MOVS.W <Rd>, #<const> // Outside IT block, and <Rd>, <const> can be represented in T1
MOVS{<c>}{<q>} <Rd>, #<const>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  setflags = (S == '1');  (imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### T3

#### *T3 variant*

```
MOV{<c>}{<q>} <Rd>, #<imm16> // <imm16> cannot be represented in T1 or T2
MOVW{<c>}{<q>} <Rd>, #<imm16> // <imm16> can be represented in T1 or T2
```

#### *Decode for this encoding*

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(imm4:i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding A2, T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<imm8> Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<imm16> For encoding A2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.

For encoding T3: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = imm32;
    if d == 15 then          // Can only occur for encoding A1
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

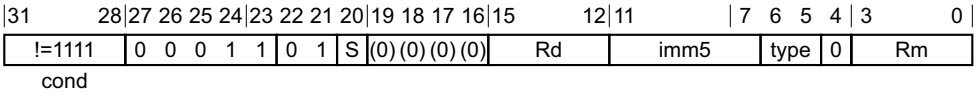
## F6.1.109 MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.



If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases ASRS (immediate), ASR (immediate), LSLS (immediate), LSL (immediate), LSRS (immediate), LSR (immediate), RORS (immediate), ROR (immediate), RRXS, and RRX. See the *Alias conditions* on page F6-2816 table for details of when each alias is preferred.

### A1

#### *MOV, rotate right with extend variant*

Applies when S = 0 && imm5 = 00000 && type = 11.

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

#### *MOV, shift or rotate by value variant*

Applies when S = 0 && !(imm5 == 00000 && type == 11).

```
MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

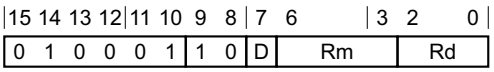
#### *MOVS, rotate right with extend variant*

Applies when S = 1 && imm5 = 00000 && type = 11.

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

#### *MOVS, shift or rotate by value variant*

Applies when S = 1 && !(imm5 == 00000 && type == 11).



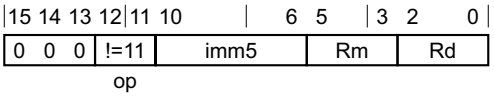
```
MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T1



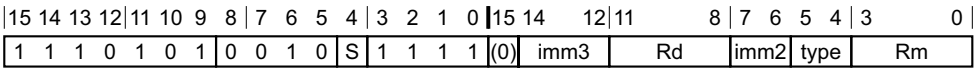
#### *T1 variant*

```
MOV{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(D:Rd);  m = UInt(Rm);  setflags = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### T2



#### *T2 variant*

```
MOV<c>{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Inside IT block
MOVS{<q>} <Rd>, <Rm> {, <shift> #<amount>} // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  setflags = TRUE;
(shift_t, shift_n) = DecodeImmShift(op, imm5);
if op == '00' && imm5 == '00000' && InITBlock() then UNPREDICTABLE;
```

### T3

#### *MOV, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

#### *MOV, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
MOV<c>.W <Rd>, <Rm> {, <shift> #<amount>} // Inside IT block, and <Rd>, <Rm>, <shift>, <amount> can be
represented in T1 or T2
MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

#### *MOVS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && imm2 = 00 && type = 11`.

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### *MOVS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
MOVS.W <Rd>, <Rm> {, <shift> #<amount>} // Outside IT block, and <Rd>, <Rm>, <shift>, <amount> can be
represented in T1 or T2
MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

### *Decode for all variants of this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *MOV (register, T32)* on page K1-5451.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of the instruction if <Rn> is not the LR, or if the optional shift or `RRX` argument is specified.

For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used:

- The instruction causes a branch to the address moved to the PC. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The instruction must either be outside an IT block or the last instruction of an IT block.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<shift> For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field. It can have the following values:

LSL when op = 00

LSR when op = 01

ASR when op = 10

<amount> For encoding A1 and T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = shifted;
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

## F6.1.110 MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases ASRS (register), ASR (register), LSLS (register), LSL (register), LSRS (register), LSR (register), RORS (register), and ROR (register). See the *Alias conditions* on page F6-2821 table for details of when each alias is preferred.

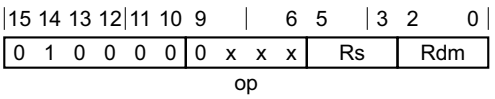
### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
MOVS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

#### *Not flag setting variant*



Applies when `S = 0`.

```
MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### T1

#### *Arithmetic shift right variant*

Applies when `op = 0100`.

```
MOV<c>{<q>} <Rdm>, <Rdm>, ASR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, ASR <Rs> // Outside IT block
```

#### *Logical shift left variant*

Applies when `op = 0010`.

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSL <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, LSL <Rs> // Outside IT block
```

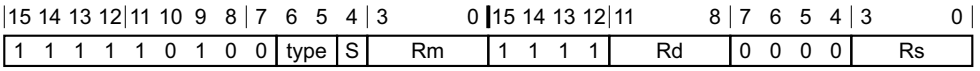
#### *Logical shift right variant*

Applies when `op = 0011`.

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, LSR <Rs> // Outside IT block
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

#### *Rotate right variant*



Applies when `op = 0111`.

```
MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, ROR <Rs> // Outside IT block
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rdn);  m = UInt(Rdn);  s = UInt(Rs);
setflags = !InITBlock();  shift_t = DecodeRegShift(op<2>:op<0>);
```

### T2

#### *Flag setting variant*

Applies when `S = 1`.

```
MOVS.W <Rd>, <Rm>, <type> <Rs> // Outside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
MOVS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

#### *Not flag setting variant*

Applies when `S = 0`.

```
MOV<c>.W <Rd>, <Rm>, <type> <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in
T1
MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

Related encodings: In encoding T1, for a `op` field value that is not described above, see *Data-processing (two low registers)* on page F3-2467.

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

| Alias | of variant | is preferred when |
|---|---|---|
| RORS (register) | T2 (flag setting) | `type == '11' && S == '1'` |
| ROR (register) | A1 (not flag setting) | `S == '0' && type == '11'` |
| ROR (register) | T1 (rotate right) | `op == '0111' && InITBlock()` |
| ROR (register) | T2 (not flag setting) | `type == '11' && S == '0'` |

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdm>` Is the general-purpose source register and the destination register, encoded in the "Rdm" field.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

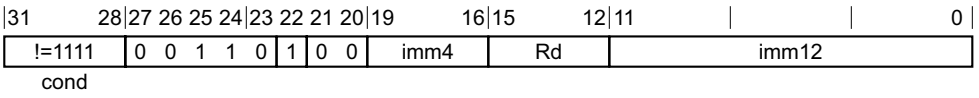
`<Rm>` Is the general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

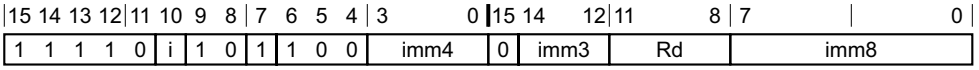
## F6.1.111 MOVT

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

### A1



#### *A1 variant*

```
MOVT{<c>}{<q>} <Rd>, #<imm16>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  imm16 = imm4:imm12;
if d == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
MOVT{<c>}{<q>} <Rd>, #<imm16>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  imm16 = imm4:i:imm3:imm8;
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

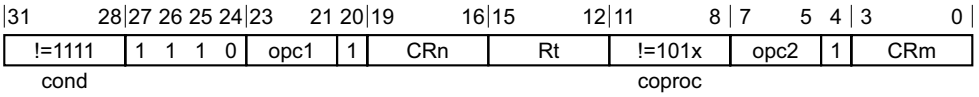
## F6.1.112 MRC, MRC2



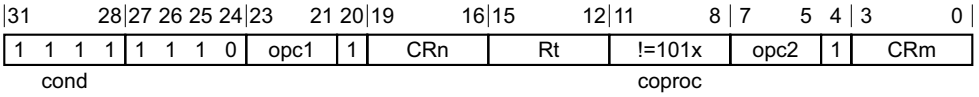
Move to general-purpose register from Coprocessor causes a conceptual coprocessor to transfer a value to a general-purpose register or to the condition flags.

This is a generic coprocessor instruction. The `coproc` field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the `opc1`, `opc2`, `CRn`, and `CRd` field values that are valid `MRC` and `MRC2` instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

In an implementation that includes EL2, `MRC` accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an `MRC` instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see .

Because of the range of possible traps to Hyp mode, the `MRC` pseudocode does not show these possible traps.

### A1



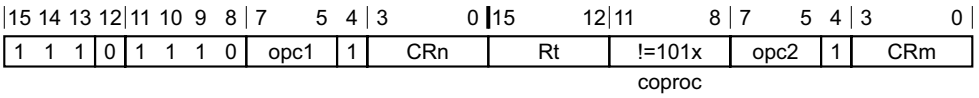
#### *A1 variant*

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

### A2



#### *A2 variant*

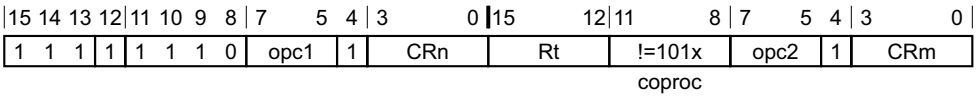
```
MRC2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

### T1

#### *T1 variant*



```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

### T2

#### *T2 variant*

```
MRC2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

#### *Decode for this encoding*

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  cp = UInt(coproc);
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

Advanced SIMD and floating-point: 8, 16, and 32-bit transfer between ARM core and extension registers.

## Assembler symbols

| | |
|---|---|
| <c> | For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.<br>For encoding A2: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <coproc> | Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15. |
| <opc1> | Is a coprocessor-specific opcode in the range 0 to 7, encoded in the "opc1" field. |
| <Rt> | Is the general-purpose register to be transferred or APSR_nzcv (encoded as 0b1111), encoded in the "Rt" field. If APSR_nzcv is used, bits [31:28] of the transferred value are written to the PSTATE condition flags. |
| <CRn> | Is the first coprocessor register, encoded in the "CRn" field. |
| <CRm> | Is the second coprocessor register, encoded in the "CRm" field. |
| <opc2> | Is a coprocessor-specific opcode in the range 0 to 7, defaulting to 0 and encoded in the "opc2" field. |

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    value = Coproc_GetOneWord(cp, ThisInstr());
    if t != 15 then
        R[t] = value;
    elsif Coproc_CanWriteAPSR(cp, ThisInstr()) then
        PSTATE.<N,Z,C,V> = value<31:28>;
```

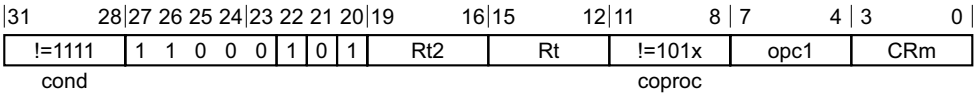
## F6.1.113 MRRC, MRRC2



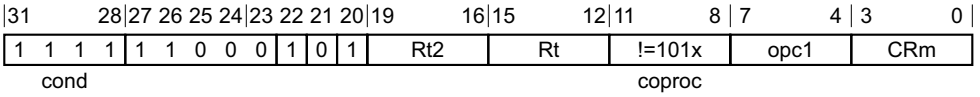
Move to two general-purpose registers from Coprocessor causes a conceptual coprocessor to transfer values to two general-purpose registers.

This is a generic coprocessor instruction. The `coproc` field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the `opc1`, and `CRm` field values that are valid `MRRC` and `MRRC2` instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

In an implementation that includes EL2, `MRRC` accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an `MRRC` instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see .

Because of the range of possible traps to Hyp mode, the `MRRC` pseudocode does not show these possible traps.

### A1



#### *A1 variant*

if coproc == '101x' then SEE "Advanced SIMD and Floating-point";
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### T2

#### *T2 variant*

```
MRRC2{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

#### *Decode for this encoding*

```
if coproc == '101x' then UNDEFINED;
t = UInt(Rt);  t2 = UInt(Rt2);  cp = UInt(coproc);
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

Advanced SIMD and floating-point: 64-bit transfers between ARM core and extension registers.

## Assembler symbols

| | |
|---|---|
| <c> | For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.<br>For encoding A2: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <coproc> | Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15. |
| <opc1> | Is a coprocessor-specific opcode in the range 0 to 15, encoded in the "opc1" field. |
| <Rt> | Is the first general-purpose register to be transferred, encoded in the "Rt" field. |
| <Rt2> | Is the second general-purpose register to be transferred, encoded in the "Rt2" field. |
| <CRm> | Is a coprocessor register, encoded in the "CRm" field. |

The relative significance of <Rt2> and {syntax{<Rt>} is IMPLEMENTATION DEFINED for IMPLEMENTATION DEFINED uses of the MCRR and MRRC instructions. For the architected uses, as described in this manual, <Rt2> transfers bits[63:32] of the selected coprocessor register, while <Rt> transfers bits[31:0].

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    (R[t2], R[t]) = Coproc_GetTwoWords(cp, ThisInstr());
```

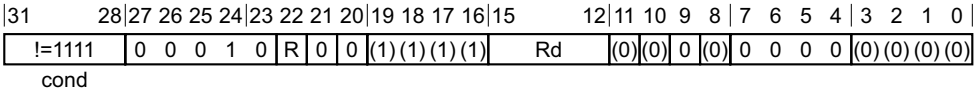
### F6.1.114 MRS



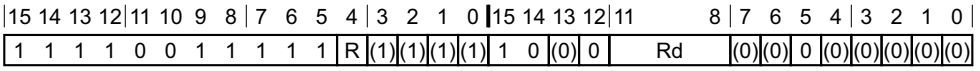
Move Special register to general-purpose register moves the value of the APSR, CPSR, or SPSR_<current_mode> into a general-purpose register.

ARM recommends the APSR form when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see APSR.

An MRS that accesses the SPSR is UNPREDICTABLE if executed in User mode or System mode.

An MRS that is executed in User mode and accesses the CPSR returns an UNKNOWN value for the CPSR.{E, A, I, F, M} fields.

#### A1



##### *A1 variant*

```
MRS{<c>}{<q>} <Rd>, <spec_reg>
```

##### *Decode for this encoding*

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE;
```

#### T1

##### *T1 variant*

```
MRS{<c>}{<q>} <Rd>, <spec_reg>
```

##### *Decode for this encoding*

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *MRS* on page K1-5481.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<spec_reg> Is the special register to be accessed, encoded in the "R" field. It can have the following values:

CPSR|APSR when R = 0

SPSR when R = 1

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if read_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            R[d] = SPSR[];
    else
        // CPSR has same bit assignments as SPSR, but with the IT, J, SS, IL, and T bits masked out.
        psr_val = GetPSRFromPSTATE() AND '11111000 00001111 00000011 11011111';
        if PSTATE.EL == EL0 then
            // If accessed from User mode return UNKNOWN values for E, A, I, F bits, bits<9:6>,
            // and for the M field, bits<4:0>
            psr_val<9:6> = bits(4) UNKNOWN;
            psr_val<4:0> = bits(5) UNKNOWN;
        R[d] = psr_val;
```

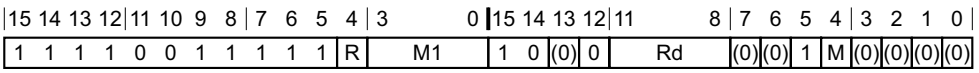
### F6.1.115 MRS (Banked register)

Move to Register from Banked or Special register moves the value from the Banked general-purpose register or SPSR of the specified mode, or the value of ELR_hyp, to a general-purpose register.

MRS (Banked register) is UNPREDICTABLE if executed in User mode.

The effect of using an MRS (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the Banked register transfer instructions* on page F6-3203.

#### A1



##### *A1 variant*

```
MRS{<c>}{<q>} <Rd>, <banked_reg>
```

##### *Decode for this encoding*

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE;
SYSm = M:M1;
```

#### T1

##### *T1 variant*

```
MRS{<c>}{<q>} <Rd>, <banked_reg>
```

##### *Decode for this encoding*

```
d = UInt(Rd);  read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
SYSm = M:M1;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<banked_reg> Is the name of the banked register to be transferred to or from, encoded in the "R:M:M1" field. It can have the following values:

| | |

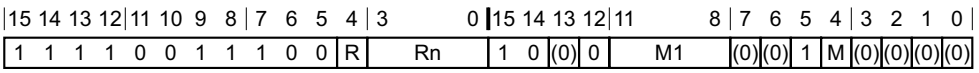
## F6.1.116 MSR (Banked register)

Move to Banked or Special register from general-purpose register moves the value of a general-purpose register to the Banked general-purpose register or SPSR of the specified mode, or to ELR_hyp.

`MSR` (Banked register) is UNPREDICTABLE if executed in User mode.

The effect of using an `MSR` (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the Banked register transfer instructions* on page F6-3203.

### A1



#### *A1 variant*

```
MSR{<c>}{<q>} <banked_reg>, <Rn>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  write_spsr = (R == '1');
if n == 15 then UNPREDICTABLE;
SYSm = M:M1;
```

### T1

#### *T1 variant*

```
MSR{<c>}{<q>} <banked_reg>, <Rn>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  write_spsr = (R == '1');
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
SYSm = M:M1;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<banked_reg> Is the name of the banked register to be transferred to or from, encoded in the "R:M:M1" field. It can have the following values:

| | |
|---|---|
| `R8_usr` | when `R = 0, M = 0, M1 = 0000` |
| `R9_usr` | when `R = 0, M = 0, M1 = 0001` |

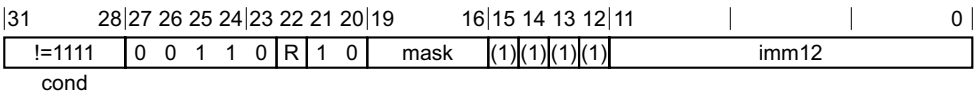
### F6.1.117 MSR (immediate)

Move immediate value to Special register moves selected bits of an immediate value to the corresponding bits in the APSR, CPSR, or SPSR_<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, the immediate form of MSR is normally only useful at the Application level for writing to APSR_nzcvq (CPSR_f).

If an MSR (immediate) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-3771.



An MSR (immediate) executed in User mode:

- Is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher,

An MSR (immediate) executed in System mode is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

#### A1

##### *A1 variant*

Applies when !(R == 0 && mask == 0000).

```
MSR{<c>}{<q>} <spec_reg>, #<imm>
```

##### *Decode for this encoding*

```
if mask == '0000' && R == '0' then SEE "Related encodings";
imm32 = A32ExpandImm(imm12);  write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
```

#### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *MSR (immediate)* on page K1-5481.

Related encodings: *Move Special Register & Hints (immediate)* on page F4-2523.

#### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<spec_reg> Is one of:

- APSR_<bits>.
- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.

x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.

s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`f` mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of `nzcvq`, `g`, or `nzcvqg`. These map to the following CPSR_<fields> values:

- `APSR_nzcvq` is the same as `CPSR_f` (mask== '1000').
- `APSR_g` is the same as `CPSR_s` (mask == '0100').
- `APSR_nzcvqg` is the same as `CPSR_fs` (mask == '1100').

ARM recommends the `APSR_<bits>` forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see APSR.

`<imm>` Is an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(imm32, mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(imm32, mask);
```

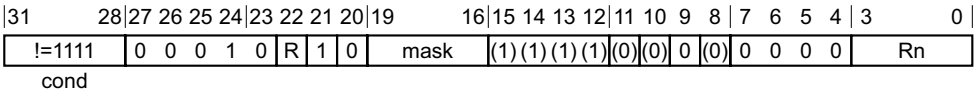
### F6.1.118 MSR (register)

Move general-purpose register to Special register moves selected bits of a general-purpose register to the APSR, CPSR or SPSR_<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, a read-modify-write sequence is normally required when the MSR instruction is being used at Application level and its destination is not APSR_nzcvq (CPSR_f).

If an MSR (register) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-3771.



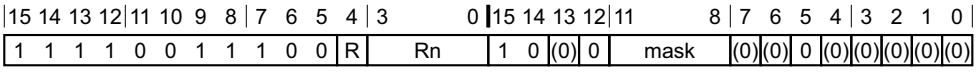
An MSR (register) executed in User mode:

- Is UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (register) executed in System mode is UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

#### A1



##### *A1 variant*

```
MSR{<c>}{<q>} <spec_reg>, <Rn>
```

##### *Decode for this encoding*

```
n = UInt(Rn);  write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
if n == 15 then UNPREDICTABLE;
```

#### T1

##### *T1 variant*

```
MSR{<c>}{<q>} <spec_reg>, <Rn>
```

##### *Decode for this encoding*

```
n = UInt(Rn);  write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<spec_reg> Is one of:

- APSR_<bits>.
- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.

x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.

s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.

f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcvq, g, or nzcvqg. These map to the following CPSR_<fields> values:

- APSR_nzcvq is the same as CPSR_f (mask== '1000').
- APSR_g is the same as CPSR_s (mask == '0100').
- APSR_nzcvqg is the same as CPSR_fs (mask == '1100').

ARM recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see APSR.

<Rn> Is the general-purpose source register, encoded in the "Rn" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(R[n], mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(R[n], mask);
```

## F6.1.119 MUL, MULS

Multiply multiplies two register values. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

Optionally, it can update the condition flags based on the result. In the T32 instruction set, this option is limited to only a few forms of the instruction. Use of this option adversely affects performance on many implementations.

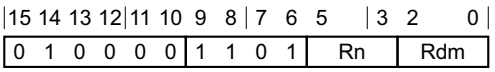
### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
MULS{<c>}{<q>} <Rd>, <Rn>{, <Rm>}
```

#### *Not flag setting variant*



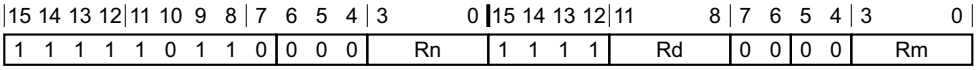
Applies when `S = 0`.

```
MUL{<c>}{<q>} <Rd>, <Rn>{, <Rm>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
MUL<c>{<q>} <Rdm>, <Rn>{, <Rdm>} // Inside IT block
MULS{<q>} <Rdm>, <Rn>{, <Rdm>} // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rdm);  n = UInt(Rn);  m = UInt(Rdm);  setflags = !InITBlock();
```

### T2

#### *T2 variant*

```
MUL<c>.W <Rd>, <Rn>{, <Rm>} // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
MUL{<c>}{<q>} <Rd>, <Rn>{, <Rm>}
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rdm> | Is the second general-purpose source register holding the multiplier and the destination register, encoded in the "Rdm" field. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field. |
| <Rm> | Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field. If omitted, <Rd> is used. |

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]);  // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]);  // operand2 = UInt(R[m]) produces the same final results
    result = operand1 * operand2;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged
```

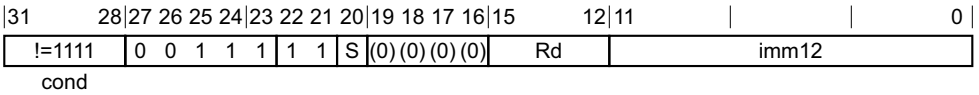
## F6.1.120 MVN, MVNS (immediate)



Bitwise NOT (immediate) writes the bitwise inverse of an immediate value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

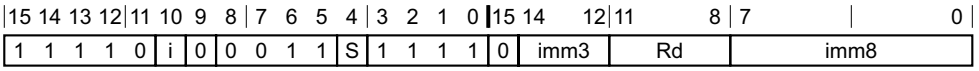
### A1

#### *MVN variant*

Applies when S = 0.

```
MVN{<c>}{<q>} <Rd>, #<const>
```

#### *MVNS variant*



Applies when S = 1.

```
MVNS{<c>}{<q>} <Rd>, #<const>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

### T1

#### *MVN variant*

Applies when S = 0.

```
MVN{<c>}{<q>} <Rd>, #<const>
```

#### *MVNS variant*

Applies when S = 1.

```
MVNS{<c>}{<q>} <Rd>, #<const>
```

Non-Confidential - Beta

### *Decode for all variants of this encoding*

```
d = UInt(Rd);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MVN variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the MVNS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = NOT(imm32);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

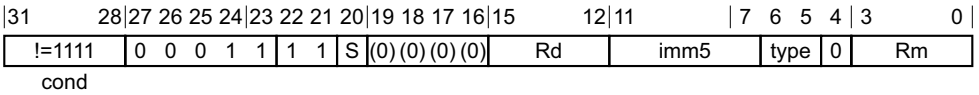
### F6.1.121 MVN, MVNS (register)



Bitwise NOT (register) writes the bitwise inverse of a register value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *MVN, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
MVN{<c>}{<q>} <Rd>, <Rm>, RRX
```

##### *MVN, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

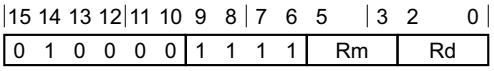
```
MVN{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

##### *MVNS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
MVNS{<c>}{<q>} <Rd>, <Rm>, RRX
```

##### *MVNS, shift or rotate by value variant*



Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.

```
MVNS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

#### T1

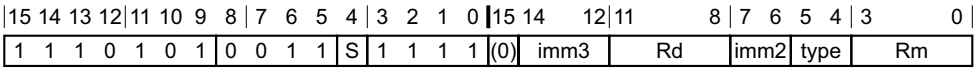
Non-Confidential - Beta



#### T1 variant

```
MVN<c>{<q>} <Rd>, <Rm> // Inside IT block
MVNS{<q>} <Rd>, <Rm> // Outside IT block
```

#### Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### MVN, rotate right with extend variant

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
MVN{<c>}{<q>} <Rd>, <Rm>, RRX
```

#### MVN, shift or rotate by value variant

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
MVN<c>.W <Rd>, <Rm> // Inside IT block, and <Rd>, <Rm> can be represented in T1
MVN{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

#### MVNS, rotate right with extend variant

Applies when `S = 1 && imm3 = 000 && imm2 = 00 && type = 11`.

```
MVNS{<c>}{<q>} <Rd>, <Rm>, RRX
```

#### MVNS, shift or rotate by value variant

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
MVNS.W <Rd>, <Rm> // Outside IT block, and <Rd>, <Rm> can be represented in T1
MVNS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

#### Decode for all variants of this encoding

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the MVN variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the MVNS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

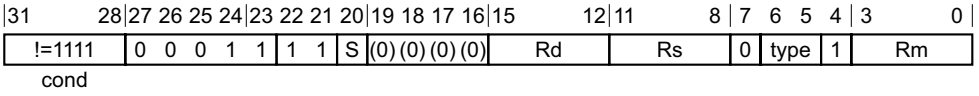
ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = NOT(shifted);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

Non-Confidential - Beta

## F6.1.122 MVN, MVNS (register-shifted register)

Bitwise NOT (register-shifted register) writes the bitwise inverse of a register-shifted register value to the destination register. It can optionally update the condition flags based on the result.

### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
MVNS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

#### *Not flag setting variant*

Applies when `S = 0`.

```
MVN{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` Is the general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
```

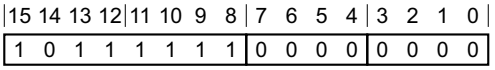
## F6.1.123 NOP

No Operation does nothing. This instruction can be used for instruction alignment purposes.

**Note**

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

### A1



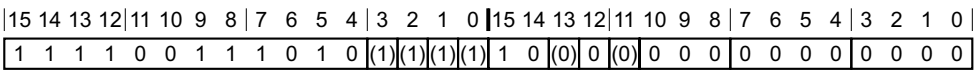
#### *A1 variant*

```
NOP{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1



#### *T1 variant*

```
NOP{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T2

#### *T2 variant*

```
NOP{<c>}.W
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### Notes for all encodings

## F6.1.124 ORN, ORNS (immediate)

Bitwise OR NOT (immediate) performs a bitwise (inclusive) OR of a register value and the complement of an immediate value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

### T1

#### *Flag setting variant*

Applies when `S = 1`.

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Not flag setting variant*

Applies when `S = 0`.

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE MVN (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

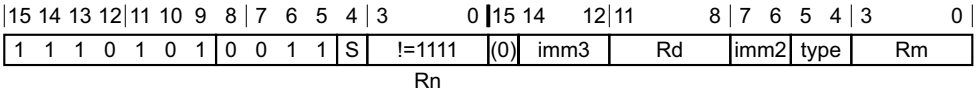
### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. |
| <Rn> | Is the general-purpose source register, encoded in the "Rn" field. |
| <const> | An immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values. |

### Operation



```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] OR NOT(imm32);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F6.1.125 ORN, ORNS (register)

Bitwise OR NOT (register) performs a bitwise (inclusive) OR of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

### T1

#### *ORN, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ORN, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *ORNS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && imm2 = 00 && type = 11`.

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ORNS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE MVN (register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the first general-purpose source register, encoded in the "Rn" field. |
| <Rm> | Is the second general-purpose source register, encoded in the "Rm" field. |

Non-Confidential - Beta

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

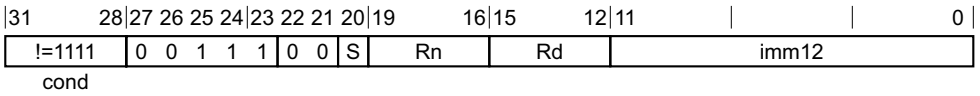
## F6.1.126 ORR, ORRS (immediate)



Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

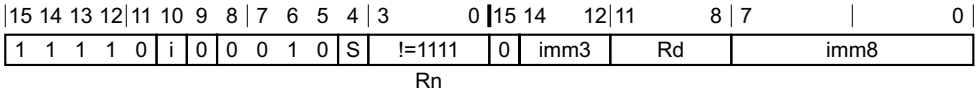
### A1

#### *ORR variant*

Applies when S = 0.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *ORRS variant*



Applies when S = 1.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

### T1

#### *ORR variant*

Applies when S = 0.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *ORRS variant*

Applies when S = 1.

Non-Confidential - Beta

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE MOV (immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

`<const>` For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] OR imm32;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

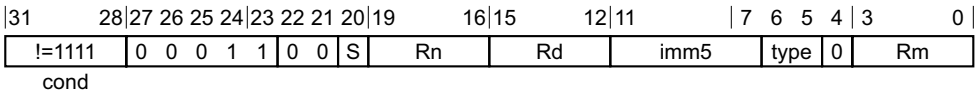
## F6.1.127 ORR, ORRS (register)



Bitwise OR (register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### A1

#### *ORR, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ORR, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

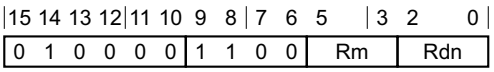
#### *ORRS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ORRS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

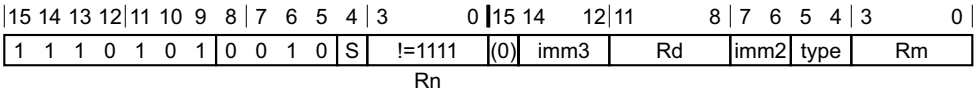
Non-Confidential - Beta

### T1



#### *T1 variant*

```
ORR<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // Inside IT block
ORRS{<q>} {<Rdn>,} <Rdn>, <Rm> // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *ORR, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ORR, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORR<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *ORRS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && imm2 = 00 && type = 11`.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *ORRS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
ORRS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE "Related encodings";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

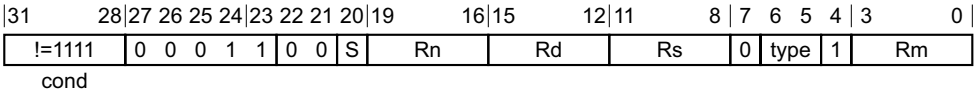
- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<c> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



```
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Non-Confidential - Beta

### F6.1.128 ORR, ORRS (register-shifted register)

Bitwise OR (register-shifted register) performs a bitwise (inclusive) OR of a register value and a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

#### A1

##### *Flag setting variant*

Applies when `S = 1`.

```
ORRS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Not flag setting variant*

Applies when `S = 0`.

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

#### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<Rs>` Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

## F6.1.129 PKHBT, PKHTB

Pack Halfword combines one halfword of its first operand with the other halfword of its shifted second operand.

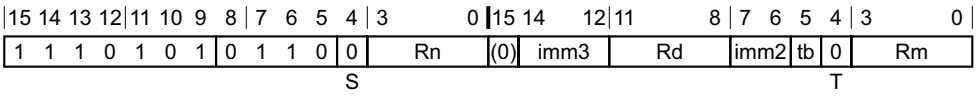
### A1

#### *PKHBT variant*

Applies when `tb = 0`.

```
PKHBT{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, LSL #<imm>}
```

#### *PKHTB variant*



Applies when `tb = 1`.

```
PKHTB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ASR #<imm>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  tbform = (tb == '1');
(shift_t, shift_n) = DecodeImmShift(tb:'0', imm5);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *PKHBT variant*

Applies when `tb = 0`.

```
PKHBT{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, LSL #<imm>} // tbform == FALSE
```

#### *PKHTB variant*

Applies when `tb = 1`.

```
PKHTB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ASR #<imm>} // tbform == TRUE
```

#### *Decode for all variants of this encoding*

```
if S == '1' || T == '1' then UNDEFINED;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  tbform = (tb == '1');
(shift_t, shift_n) = DecodeImmShift(tb:'0', imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<imm>` For encoding A1: the shift to apply to the value read from `<Rm>`, encoded in imm5. Is one of:

`omitted` No shift, encoded as `0b00000`.

`1-31` Left shift by specified number of bits, encoded as a binary number.

For encoding A1: the shift to apply to the value read from `<Rm>`, encoded in imm5. Is one of:

`omitted` Instruction is a pseudo-instruction and is assembled as though `PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn>` had been written.

`1-32` Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as `0b00000`. Other shift amounts are encoded as binary numbers.

**Note**

An assembler can permit `<imm>` = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

For encoding T1: the shift to apply to the value read from `<Rm>`, encoded in imm3:imm2. For `PKHBT`, it is one of:

`omitted` No shift, encoded as `0b00000`.

`1-31` Left shift by specified number of bits, encoded as a binary number.

For `PKHTB`, it is one of:

`omitted` Instruction is a pseudo-instruction and is assembled as though `PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn>` had been written.

`1-32` Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as `0b00000`. Other shift amounts are encoded as binary numbers.

**Note**

An assembler can permit `<imm>` = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = Shift(R[m], shift_t, shift_n, PSTATE.C);  // PSTATE.C ignored
    R[d]<15:0>  = if tbform then operand2<15:0> else R[n]<15:0>;
    R[d]<31:16> = if tbform then R[n]<31:16>    else operand2<31:16>;
```

## F6.1.130 PLD, PLDW (immediate)

Preload Data (immediate) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2361.

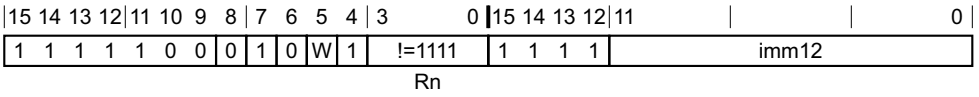
### A1

#### *Preload read variant*

Applies when R = 1.

```
PLD{<c>}{<q>} [<Rn> {, #{+/-}<imm>}]
```

#### *Preload write variant*



Applies when R = 0.

```
PLDW{<c>}{<q>} [<Rn> {, #{+/-}<imm>}]
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');  is_pldw = (R == '0');
```

### T1

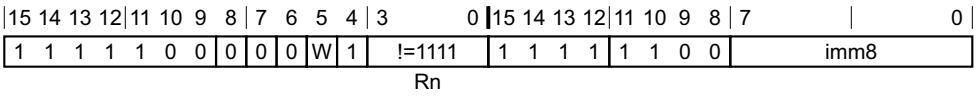
#### *Preload read variant*

Applies when W = 0.

```
PLD{<c>}{<q>} [<Rn> {, #{+}<imm>}]
```

#### *Preload write variant*

Applies when W = 1.



```
PLDW{<c>}{<q>} [<Rn> {, #{+}<imm>}]
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = TRUE;  is_pldw = (W == '1');
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T2

#### *Preload read variant*

Applies when `W = 0`.

```
PLD{<c>}{<q>} [<Rn> {, #-<imm>}]
```

#### *Preload write variant*

Applies when `W = 1`.

```
PLDW{<c>}{<q>} [<Rn> {, #-<imm>}]
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);  add = FALSE;  is_pldw = (W == '1');
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-2446. Must be `AL` or omitted.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see PLD (literal).

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

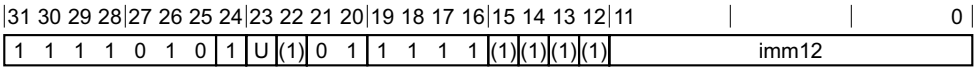
`<imm>` For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (R[n] + imm32) else (R[n] - imm32);
    if is_pldw then
        Hint_PreloadDataForWrite(address);
    else
        Hint_PreloadData(address);
```



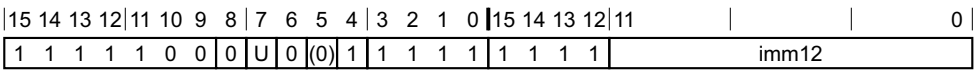
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F6.1.131 PLD (literal)

Preload Data (literal) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The effect of a PLD instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2361.

#### A1



##### *A1 variant*

```
PLD{<c>}{<q>} <label> // Normal form
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative form
```

##### *Decode for this encoding*

```
imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

#### T1

##### *T1 variant*

```
PLD{<c>}{<q>} <label> // Preferred syntax
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax
```

##### *Decode for this encoding*

```
imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2446. Must be AL or omitted.
For encoding T1: see *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<label> The label of the literal data item that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. The offset must be in the range –4095 to 4095. If the offset is zero or positive, imm32 is equal to the offset and add == TRUE. If the offset is negative, imm32 is equal to minus the offset and add == FALSE.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    Hint_PreloadData(address);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

## F6.1.132 PLD, PLDW (register)

Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2361.

### A1

#### *Preload read, optional shift or rotate variant*

Applies when `R = 1 && !(imm5 == 00000 && type == 11)`.

```
PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

#### *Preload read, rotate right with extend variant*

Applies when `R = 1 && imm5 = 00000 && type = 11`.

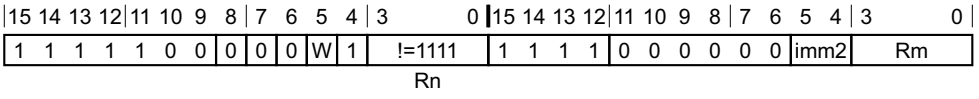
```
PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

#### *Preload write, optional shift or rotate variant*

Applies when `R = 0 && !(imm5 == 00000 && type == 11)`.

```
PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

#### *Preload write, rotate right with extend variant*



Applies when `R = 0 && imm5 = 00000 && type = 11`.

```
PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);  add = (U == '1');  is_pldw = (R == '0');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 || (n == 15 && is_pldw) then UNPREDICTABLE;
```

### T1

#### *Preload read variant*

Applies when `W = 0`.

```
PLD{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

#### *Preload write variant*

Applies when `W = 1`.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
PLDW{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

### Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn);  m = UInt(Rm);  add = TRUE;  is_pldw = (W == '1');
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted.

For encoding T1: see *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

\+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    if is_pldw then
        Hint_PreloadDataForWrite(address);
    else
        Hint_PreloadData(address);
```

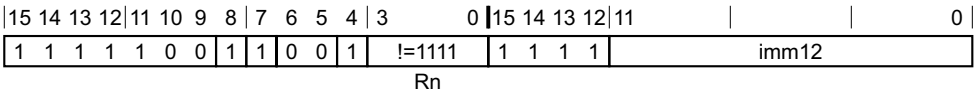
### F6.1.133 PLI (immediate, literal)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2361.

#### A1



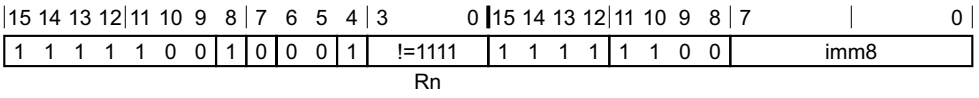
##### *A1 variant*

```
PLI{<c>}{<q>} [<Rn> {, #{+/-}<imm>}]
PLI{<c>}{<q>} <label> // Normal form
PLI{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative form
```

##### *Decode for this encoding*

```
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

#### T1



##### *T1 variant*

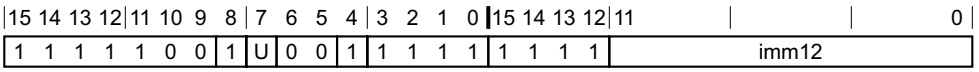
```
PLI{<c>}{<q>} [<Rn> {, #{+}<imm>}]
```

##### *Decode for this encoding*

```
if Rn == '1111' then SEE encoding T3;
n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);  add = TRUE;
```

#### T2

##### *T2 variant*



```
PLI{<c>}{<q>} [<Rn> {, #-<imm>}]
```

##### *Decode for this encoding*

```
if Rn == '1111' then SEE encoding T3;
n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);  add = FALSE;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T3

#### *T3 variant*

```
PLI{<c>}{<q>} <label> // Preferred syntax
PLI{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax
```

#### *Decode for this encoding*

```
n = 15;  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-2446. Must be `AL` or omitted.

For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<label>` The label of the instruction that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. The offset must be in the range –4095 to 4095. If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

For encoding T3: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For the literal forms of the instruction, encoding T3 is used, or Rn is encoded as `0b1111` in encoding A1, to indicate that the PC is the base register.

The alternative literal syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F1-2409.

### F6.1.134 PLI (register)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-2361.

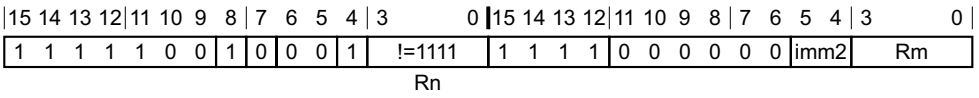
#### A1

##### *Rotate right with extend variant*

Applies when `imm5 = 00000 && type = 11`.

```
PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

##### *Shift or rotate by value variant*



Applies when `!(imm5 == 00000 && type == 11)`.

```
PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

##### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);  add = (U == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
```

#### T1

##### *T1 variant*

```
PLI{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

##### *Decode for this encoding*

```
if Rn == '1111' then SEE PLI (immediate, literal);
n = UInt(Rn);  m = UInt(Rm);  add = TRUE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: see *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    Hint_PreloadInstr(address);
```

## F6.1.135 POP

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

### T1

#### *T1 variant*

```
POP{<c>}{<q>} <registers> // Preferred syntax
LDM{<c>}{<q>} SP!, <registers> // Alternate syntax
```

#### *Decode for this encoding*

```
registers = P:'0000000':register_list;   UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *POP (T32)* on page K1-5452 and .

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the PC. If the PC is in the list, the "P" field is set to 1, otherwise this field defaults to 0. If the PC is in the list, the instruction must be either outside any IT block, or the last instruction in an IT block.

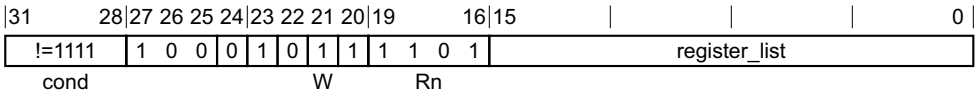
### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = if UnalignedAllowed then MemU[address,4] else MemA[address,4];
            address = address + 4;
    if registers<15> == '1' then
        if UnalignedAllowed then
            if address<1:0> == '00' then
                LoadWritePC(MemU[address,4]);
            else
                UNPREDICTABLE;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
    else
        LoadWritePC(MemA[address,4]);
if registers<13> == '0' then SP = SP + 4*BitCount(registers);
if registers<13> == '1' then SP = bits(32) UNKNOWN;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



### F6.1.136 POP (multiple registers)

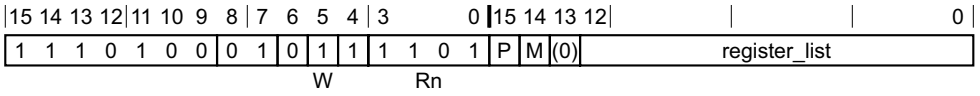
Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data

This instruction is an alias of the LDM, LDMIA, LDMFD instruction. This means that:

- The encodings in this description are named to match the encodings of LDM, LDMIA, LDMFD.
- The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.

#### A1

##### *A1 variant*



```
POP{<c>}{<q>} <registers>
```

is equivalent to

```
LDM{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(register_list) > 1`.

#### T2

##### *T2 variant*

```
POP{<c>}{<q>} <registers>
```

is equivalent to

```
LDM{<c>}{<q>} SP!, <registers>
```

and is the preferred disassembly when `BitCount(register_list) > 1`.

#### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<registers>` For encoding A1: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453. If the SP is in the list, the value of the SP after such an instruction is UNKNOWN. The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318. ARM deprecates the use of this instruction with both the LR and the PC in the list.

For encoding T2: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of*

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

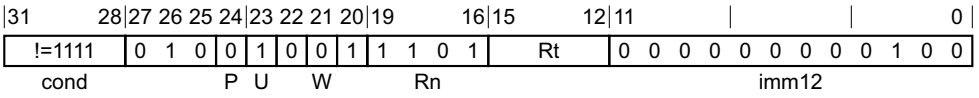
*lists of general-purpose registers and the PC* on page F2-2453. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0. The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

### Operation for all encodings

The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



## F6.1.137 POP (single register)

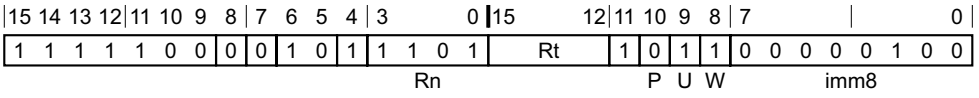
Pop Single Register from Stack loads a single general-purpose register from the stack, loading from the address in SP, and updates SP to point just above the loaded data

This instruction is an alias of the LDR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of LDR (immediate).
- The description of LDR (immediate) gives the operational pseudocode for this instruction.

### A1

#### *Post-indexed variant*



```
POP{<c>}{<q>} <single_register_list>
```

is equivalent to

```
LDR{<c>}{<q>} <Rt>, [SP], #4
```

and is always the preferred disassembly.

### T4

#### *Post-indexed variant*

```
POP{<c>}{<q>} <single_register_list>
```

is equivalent to

```
LDR{<c>}{<q>} <Rt>, [SP], #4
```

and is always the preferred disassembly.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<single_register_list>

Is the general-purpose register <Rt> to be loaded surrounded by { and }.

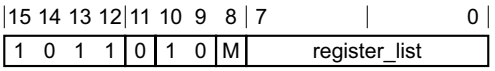
<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

### Operation for all encodings

The description of LDR (immediate) gives the operational pseudocode for this instruction.



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.138 PUSH

Push Multiple Registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

### T1

#### *T1 variant*

```
PUSH{<c>}{<q>} <registers> // Preferred syntax
STMDB{<c>}{<q>} SP!, <registers> // Alternate syntax
```

#### *Decode for this encoding*

```
registers = '0':M:'000000':register_list;  UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *PUSH* on page K1-5453.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

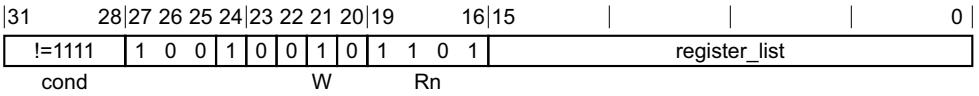
<q> See *Standard assembler syntax fields* on page F2-2446.

<registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the LR. If the LR is in the list, the "M" field is set to 1, otherwise this field defaults to 0.

### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == 13 && i != LowestSetBit(registers) then  // Only possible for encoding A1
                MemA[address,4] = bits(32) UNKNOWN;
            else
                if UnalignedAllowed then
                    MemU[address,4] = R[i];
                else
                    MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then  // Only possible for encoding A1 or A2
        if UnalignedAllowed then
            MemU[address,4] = PCStoreValue();
        else
            MemA[address,4] = PCStoreValue();
    SP = SP - 4*BitCount(registers);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



### F6.1.139 PUSH (multiple registers)

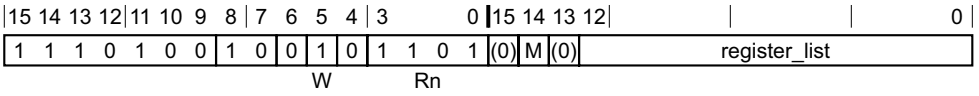
Push multiple registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data

This instruction is an alias of the STMDB, STMFD instruction. This means that:

- The encodings in this description are named to match the encodings of STMDB, STMFD.
- The description of STMDB, STMFD gives the operational pseudocode for this instruction.

#### A1

##### *A1 variant*



`PUSH{<c>}{<q>} <registers>`

is equivalent to

`STMDB{<c>}{<q>} SP!, <registers>`

and is the preferred disassembly when `BitCount(register_list) > 1`.

#### T1

##### *T1 variant*

`PUSH{<c>}{<q>} <registers>`

is equivalent to

`STMDB{<c>}{<q>} SP!, <registers>`

and is the preferred disassembly when `BitCount(register_list) > 1`.

#### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<registers>` For encoding A1: is a list of two or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453. The SP and PC can be in the list. However:

- ARM deprecates the use of instructions that include the PC in the list.
- If the SP is in the list, and it is not the lowest-numbered register in the list, the instruction stores an UNKNOWN value for the SP.

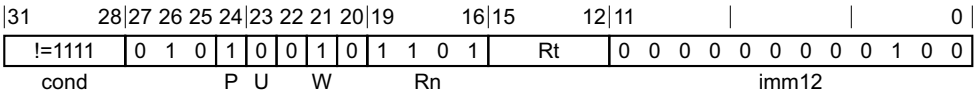
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

### Operation for all encodings

The description of STMDB, STMFD gives the operational pseudocode for this instruction.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



### F6.1.140 PUSH (single register)

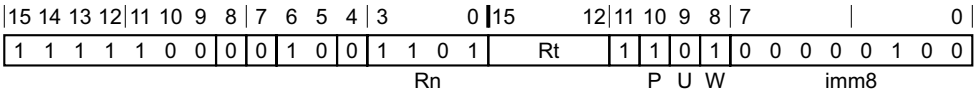
Push Single Register to Stack stores a single general-purpose register to the stack, storing to the 32-bit word below the address in SP, and updates SP to point to the start of the stored data

This instruction is an alias of the STR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of STR (immediate).
- The description of STR (immediate) gives the operational pseudocode for this instruction.

#### A1

##### *Pre-indexed variant*



```
PUSH{<c>}{<q>} <single_register_list>
```

is equivalent to

```
STR{<c>}{<q>} <Rt>, [SP, #4]!
```

and is always the preferred disassembly.

#### T4

##### *Pre-indexed variant*

```
PUSH{<c>}{<q>} <single_register_list> // Standard syntax
```

is equivalent to

```
STR{<c>}{<q>} <Rt>, [SP, #-4]!
```

and is always the preferred disassembly.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

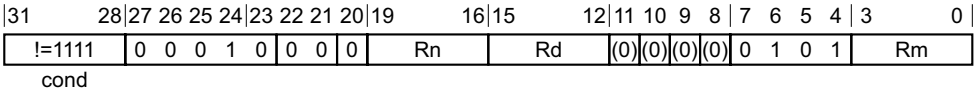
<single_register_list>

Is the general-purpose register <Rt> to be stored surrounded by { and }.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

### Operation for all encodings



The description of STR (immediate) gives the operational pseudocode for this instruction.

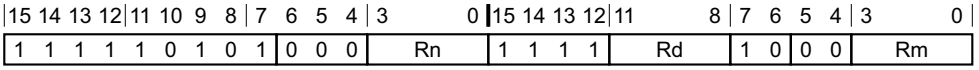
## F6.1.141 QADD

Saturating Add adds two register values, saturates the result to the 32-bit signed integer range $-2^{31}$ to $(2^{31} - 1)$, and writes the result to the destination register. If saturation occurs, it sets PSTATE.Q to 1.

### A1



#### *A1 variant*

```
QADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
QADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

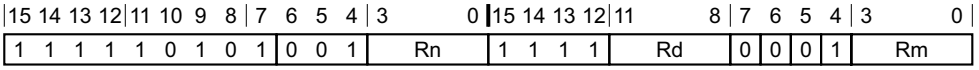
## F6.1.142 QADD16

Saturating Add 16 performs two 16-bit integer additions, saturates the results to the 16-bit signed integer range $-2^{15} <= x <= 2^{15} - 1$, and writes the results to the destination register.

### A1



#### *A1 variant*

```
QADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
QADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

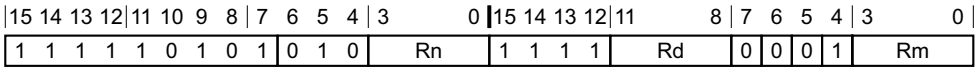
## F6.1.144 QASX

Saturating Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer addition and one 16-bit subtraction, saturates the results to the 16-bit signed integer range $-2^{15} <= x <= 2^{15} - 1$, and writes the results to the destination register.

### A1



#### *A1 variant*

```
QASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
QASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

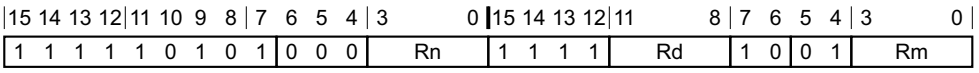
## F6.1.145 QDADD

Saturating Double and Add adds a doubled register value to another register value, and writes the result to the destination register. Both the doubling and the addition have their results saturated to the 32-bit signed integer range $-2^{31} <= x <= 2^{31} - 1$. If saturation occurs in either operation, it sets PSTATE.Q to 1.

### A1



#### *A1 variant*

```
QDADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
QDADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

Non-Confidential - Beta

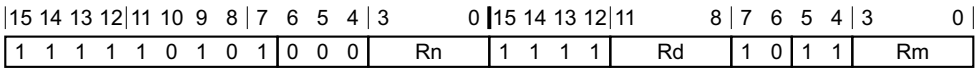
## F6.1.146 QDSUB

Saturating Double and Subtract subtracts a doubled register value from another register value, and writes the result to the destination register. Both the doubling and the subtraction have their results saturated to the 32-bit signed integer range $-2^{31} <= x <= 2^{31} - 1$. If saturation occurs in either operation, it sets PSTATE.Q to 1.

### A1



#### *A1 variant*

```
QDSUB{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
QDSUB{<c>}{<q>} {<Rd>,} <Rm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

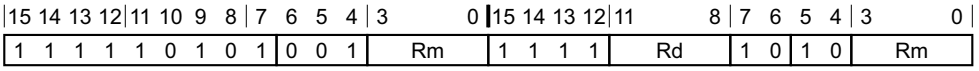
## F6.1.151 RBIT

Reverse Bits reverses the bit order in a 32-bit register.

### A1



#### *A1 variant*

```
RBIT{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
RBIT{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
if !Consistent(Rm) then UNPREDICTABLE;
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *RBIT* on page K1-5454.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rm> | For encoding A1: is the general-purpose source register, encoded in the "Rm" field.<br>For encoding T1: is the general-purpose source register, encoded in the "Rm" field. Its number must be encoded twice. |

### Operation for all encodings

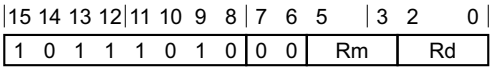
## F6.1.152 REV

Byte-Reverse Word reverses the byte order in a 32-bit register.

### A1



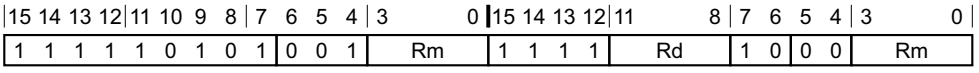
#### *A1 variant*

```
REV{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
REV{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);
```

### T2

#### *T2 variant*

```
REV{<c>}.W <Rd>, <Rm> // <Rd>, <Rm> can be represented in T1
REV{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
if !Consistent(Rm) then UNPREDICTABLE;
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

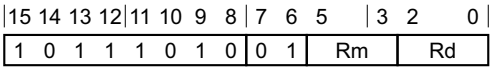
## F6.1.153 REV16

Byte-Reverse Packed Halfword reverses the byte order in each16-bit halfword of a 32-bit register.

### A1



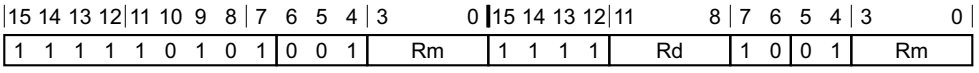
#### *A1 variant*

```
REV16{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
REV16{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);
```

### T2

#### *T2 variant*

```
REV16{<c>}.W <Rd>, <Rm> // <Rd>, <Rm> can be represented in T1
REV16{<c>}{<q>} <Rd>, <Rm>
```

#### *Decode for this encoding*

```
if !Consistent(Rm) then UNPREDICTABLE;
d = UInt(Rd);  m = UInt(Rm);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *REV16* on page K1-5455.

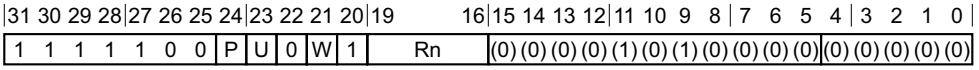
## F6.1.155 RFE, RFEDA, RFEDB, RFEIA, RFEIB

Return From Exception loads two consecutive memory locations using an address in a base register:



- The word loaded from the lower address is treated as an instruction address. The PE branches to it.
- The word loaded from the higher address is used to restore PSTATE. This word must be in the format of an SPSR.

An address adjusted by the size of the data loaded can optionally be written back to the base register.

The PE checks the value of the word loaded from the higher address for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.

RFE is UNDEFINED in Hyp mode and CONSTRAINED UNPREDICTABLE in User mode.

### A1

#### *Decrement After variant*

Applies when `P = 0 && U = 0`.

```
RFEDA{<c>}{<q>} <Rn>{!}
```

#### *Decrement Before variant*

Applies when `P = 1 && U = 0`.

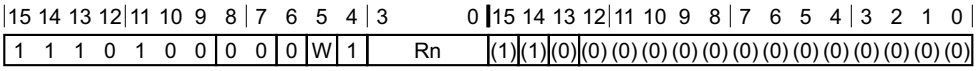
```
RFEDB{<c>}{<q>} <Rn>{!}
```

#### *Increment After variant*

Applies when `P = 0 && U = 1`.

```
RFE{IA}{<c>}{<q>} <Rn>{!}
```

#### *Increment Before variant*



Applies when `P = 1 && U = 1`.

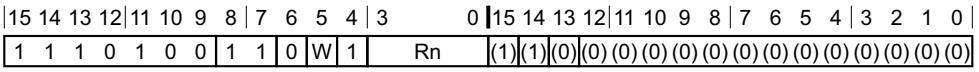
```
RFEIB{<c>}{<q>} <Rn>{!}
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);
wback = (W == '1');  increment = (U == '1');  wordhigher = (P == U);
if n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*



```
RFEDB{<c>}{<q>} <Rn>{!} // Outside or last in IT block
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

#### *Decode for this encoding*

```
n = UInt(Rn);  wback = (W == '1');  increment = FALSE;  wordhigher = FALSE;
if n == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### T2

#### *T2 variant*

```
RFE{IA}{<c>}{<q>} <Rn>{!} // Outside or last in IT block
```

#### *Decode for this encoding*

```
n = UInt(Rn);  wback = (W == '1');  increment = TRUE;  wordhigher = FALSE;
if n == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *RFE* on page K1-5482.

## Assembler symbols

| | |
|---|---|
| IA | For encoding A1: is an optional suffix to indicate the Increment After variant.<br>For encoding T2: is an optional suffix for the Increment After form. |
| <c> | For encoding A1: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted.<br>For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rn> | Is the general-purpose base register, encoded in the "Rn" field. |
| ! | The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0. |

RFEFA, RFEEA, RFEFD, and RFEED are pseudo-instructions for RFEDA, RFEDB, RFEIA, and RFEIB respectively, referring to their use for popping data from Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.EL == EL0 then
        UNPREDICTABLE;                          // UNDEFINED or NOP
    else
        address = if increment then R[n] else R[n]-8;
        if wordhigher then address = address+4;
        new_pc_value = MemA[address,4];
        spsr = MemA[address+4,4];
        if wback then R[n] = if increment then R[n]+8 else R[n]-8;
        AArch32.ExceptionReturn(new_pc_value, spsr);
```

### F6.1.156 ROR (immediate)

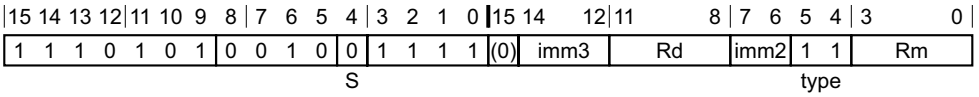
Rotate Right (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

#### A1

##### *MOV, shift or rotate by value variant*



```
ROR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

#### T3

##### *MOV, shift or rotate by value variant*

Applies when `!(imm3 == 000 && imm2 == 00)`.

```
ROR{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T3: is the general-purpose source register, encoded in the "Rm" field.

## F6.1.157 ROR (register)

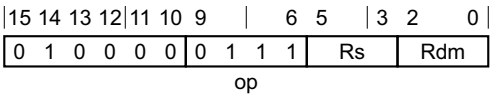
Rotate Right (register) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

### A1

#### *Not flag setting variant*



```
ROR{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

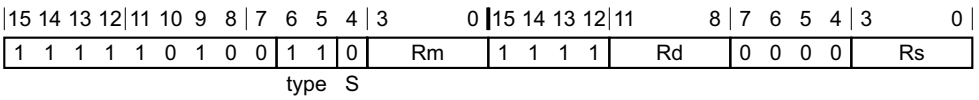
is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>
```

and is always the preferred disassembly.

### T1

#### *Rotate right variant*



```
ROR<c>{<q>} {<Rdm>,} <Rdm>, <Rs> // Inside IT block
```

is equivalent to

```
MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs>
```

and is the preferred disassembly when `InITBlock()`.

### T2

#### *Not flag setting variant*

```
ROR<c>.W {<Rd>,} <Rm>, <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.

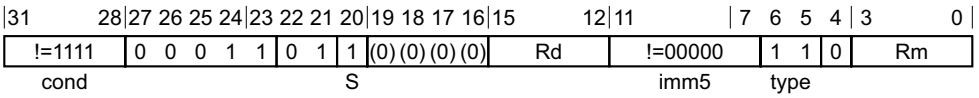
## F6.1.158 RORS (immediate)

Rotate Right, setting flags (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

If the destination register is not the PC, this instruction updates the condition flags based on the result.



The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

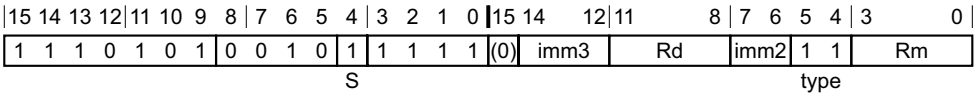
- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### A1

#### *MOVS, shift or rotate by value variant*



```
RORS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

### T3

#### *MOVS, shift or rotate by value variant*

Applies when `!(imm3 == 000 && imm2 == 00)`.

```
RORS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>
```

and is always the preferred disassembly.

## F6.1.159 RORS (register)

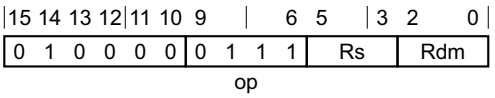
Rotate Right, setting flags (register) provides the value of the contents of a register rotated by a variable number of bits, and updates the condition flags based on the result. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

### A1

#### *Flag setting variant*



```
RORS{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

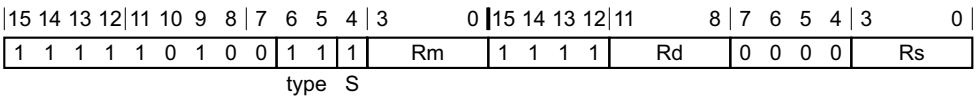
is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>
```

and is always the preferred disassembly.

### T1

#### *Rotate right variant*



```
RORS{<q>} {<Rdm>,} <Rdm>, <Rs> // Outside IT block
```

is equivalent to

```
MOVS{<q>} <Rdm>, <Rdm>, ROR <Rs>
```

and is the preferred disassembly when `!InITBlock()`.

### T2

#### *Flag setting variant*

```
RORS.W {<Rd>,} <Rm>, <Rs> // Outside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

and is always the preferred disassembly.

```
RORS{<c>}{<q>} {<Rd>,} <Rm>, <Rs>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>
```

and is always the preferred disassembly.

## F6.1.160 RRX

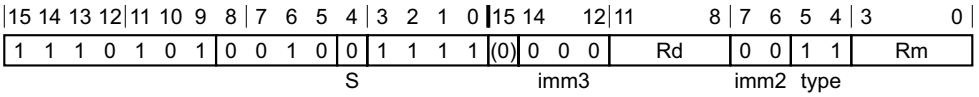
Rotate Right with Extend provides the value of the contents of a register shifted right by one place, with the Carry flag shifted into bit[31].

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### A1

#### *MOV, rotate right with extend variant*



```
RRX{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

### T3

#### *MOV, rotate right with extend variant*

```
RRX{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field.

`<Rm>` For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T3: is the general-purpose source register, encoded in the "Rm" field.

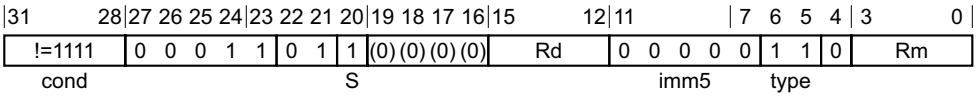
## F6.1.161 RRXS

Rotate Right with Extend, setting flags provides the value of the contents of a register shifted right by one place, with the Carry flag shifted into bit[31].

If the destination register is not the PC, this instruction updates the condition flags based on the result, and bit[0] is shifted into the Carry flag.



The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

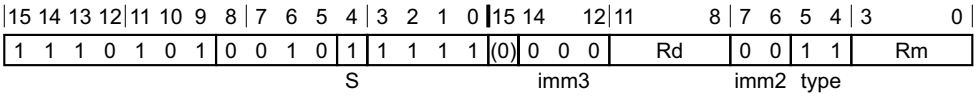
- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

### A1

#### *MOVS, rotate right with extend variant*



```
RRXS{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

### T3

#### *MOVS, rotate right with extend variant*

```
RRXS{<c>}{<q>} {<Rd>,} <Rm>
```

is equivalent to

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

and is always the preferred disassembly.

### Assembler symbols

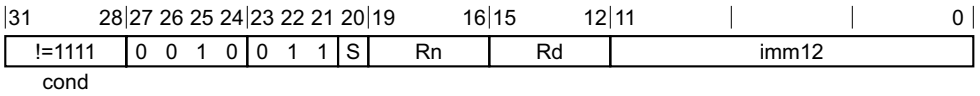
## F6.1.162 RSB, RSBS (immediate)



Reverse Subtract (immediate) subtracts a register value from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

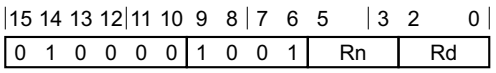
### A1

#### *RSB variant*

Applies when S = 0.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *RSBS variant*



Applies when S = 1.

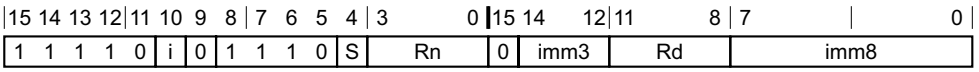
```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

### T1

#### *T1 variant*



```
RSB<c>{<q>} {<Rd>, }<Rn>, #0 // Inside IT block
RSBS{<q>} {<Rd>, }<Rn>, #0 // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = !InITBlock();  imm32 = Zeros(32); // immediate = #0
```

### T2

#### *RSB variant*

Applies when `S = 0`.

```
RSB<c>.W {<Rd>,} <Rn>, #0 // Inside IT block
RSB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *RSBS variant*

Applies when `S = 1`.

```
RSBS.W {<Rd>,} <Rn>, #0 // Outside IT block
RSBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1 and T2: is the general-purpose source register, encoded in the "Rn" field.

`<const>` For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(NOT(R[n]), imm32, '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

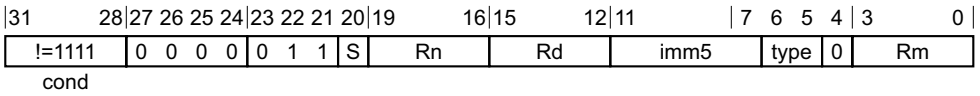
### F6.1.163 RSB, RSBS (register)



Reverse Subtract (register) subtracts a register value from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *RSB, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *RSB, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

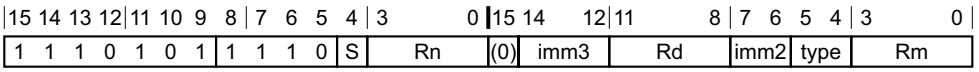
##### *RSBS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *RSBS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

### T1

#### *RSB, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *RSB, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *RSBS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && imm2 = 00 && type = 11`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *RSBS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

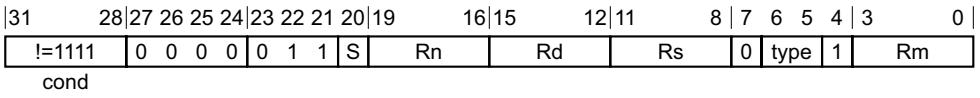
ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

## F6.1.164 RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Not flag setting variant*

Applies when `S = 0`.

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

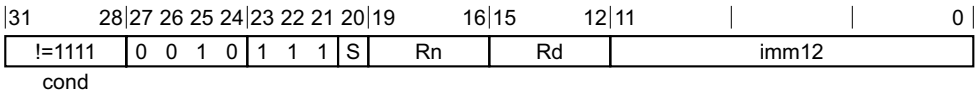
### F6.1.165 RSC, RSCS (immediate)



Reverse Subtract with Carry (immediate) subtracts a register value and the value of NOT (Carry flag) from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *RSC variant*

Applies when S = 0.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *RSCS variant*

Applies when S = 1.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

#### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the RSCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

<Rn> Is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

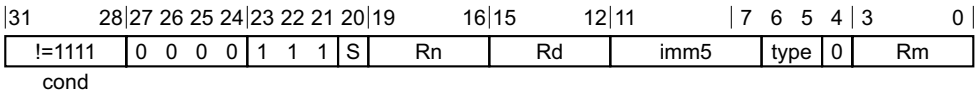
### F6.1.166 RSC, RSCS (register)



Reverse Subtract with Carry (register) subtracts a register value and the value of NOT (Carry flag) from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *RSC, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *RSC, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *RSCS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *RSCS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the RSC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the RSCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

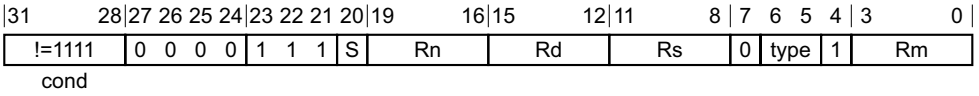
LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

## Operation



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, PSTATE.C);
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

## F6.1.167 RSC, RSCS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value and the value of NOT (Carry flag) from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
RSCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Not flag setting variant*

Applies when `S = 0`.

```
RSC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |

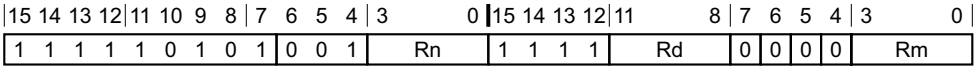
## F6.1.168 SADD16

Signed Add 16 performs two 16-bit signed integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

### A1



#### *A1 variant*

```
SADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |

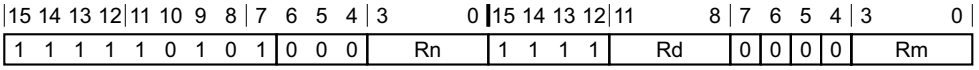
## F6.1.169 SADD8

Signed Add 8 performs four 8-bit signed integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

### A1



#### *A1 variant*

```
SADD8{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SADD8{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the first general-purpose source register, encoded in the "Rn" field. |
| <Rm> | Is the second general-purpose source register, encoded in the "Rm" field. |

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = SInt(R[n]<7:0>) + SInt(R[m]<7:0>);
    sum2 = SInt(R[n]<15:8>) + SInt(R[m]<15:8>);

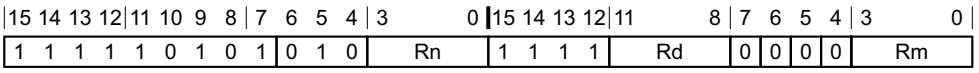
## F6.1.170 SASX

Signed Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer addition and one 16-bit subtraction, and writes the results to the destination register. It sets PSTATE.GE according to the results.

### A1



#### *A1 variant*

```
SASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    diff = SInt(R[n]<15:0>) - SInt(R[m]<31:16>);
    sum  = SInt(R[n]<31:16>) + SInt(R[m]<15:0>);
```

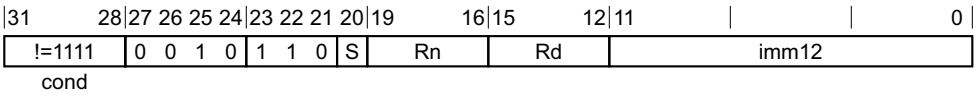
*Non-Confidential - Beta*

## F6.1.171 SBC, SBCS (immediate)



Subtract with Carry (immediate) subtracts an immediate value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

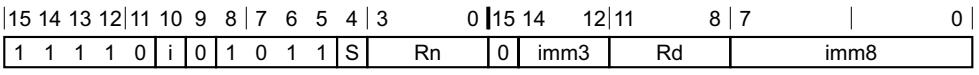
### A1

#### *SBC variant*

Applies when S = 0.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *SBCS variant*



Applies when S = 1.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

### T1

#### *SBC variant*

Applies when S = 0.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *SBCS variant*

Applies when S = 1.

Non-Confidential - Beta

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

### F6.1.173 SBC, SBCS (register-shifted register)

Subtract with Carry (register-shifted register) subtracts a register-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

#### A1

##### *Flag setting variant*

Applies when `S = 1`.

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Not flag setting variant*

Applies when `S = 0`.

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

#### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

- `LSL` when `type = 00`
- `LSR` when `type = 01`
- `ASR` when `type = 10`
- `ROR` when `type = 11`

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

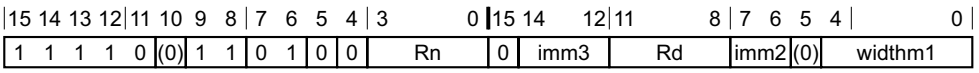
## F6.1.174 SBFX

Signed Bit Field Extract extracts any number of adjacent bits at any position from a register, sign-extends them to 32 bits, and writes the result to the destination register.

### A1



#### *A1 variant*

```
SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(lsb);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(imm3:imm2);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *SBFX* on page K1-5455.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the general-purpose source register, encoded in the "Rn" field. |
| <lsb> | For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.<br>For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field. |
| <width> | Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1. |

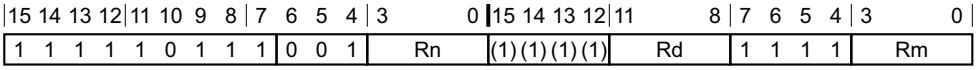
## F6.1.175 SDIV

Signed Divide divides a 32-bit signed integer register value by a 32-bit signed integer register value, and writes the result to the destination register. The condition flags are not affected.

### A1



#### *A1 variant*

```
SDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see .

## Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the first general-purpose source register holding the dividend, encoded in the "Rn" field. |
| <Rm> | Is the second general-purpose source register holding the divisor, encoded in the "Rm" field. |

## Overflow

If the signed integer division `0x80000000` / `0xFFFFFFFF` is performed, the pseudocode produces the intermediate integer result $+2^{31}$, that overflows the 32-bit signed integer range. No indication of this overflow case is produced, and the 32-bit result written to <Rd> must be the bottom 32 bits of the binary representation of $+2^{31}$. So the result of the division is `0x80000000`.

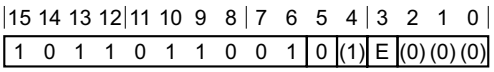
## F6.1.177 SETEND

Set Endianness writes a new value to PSTATE.E.

### A1



#### *A1 variant*

```
SETEND{<q>} <endian_specifier> // Cannot be conditional
```

#### *Decode for this encoding*

```
set_bigend = (E == '1');
```

### T1

#### *T1 variant*

```
SETEND{<q>} <endian_specifier> // Not permitted in IT block
```

#### *Decode for this encoding*

```
set_bigend = (E == '1');
if InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

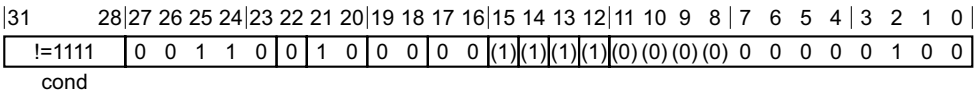
<q> See *Standard assembler syntax fields* on page F2-2446.

<endian_specifier> Is the endianness to be selected, and the value to be set in PSTATE.E, encoded in the "E" field. It can have the following values:

LE when E = 0

BE when E = 1

### Operation for all encodings



```
EncodingSpecificOperations();
AArch32.CheckSETENDEnabled();
PSTATE.E = if set_bigend then '1' else '0';
```

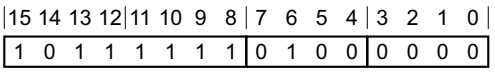
## F6.1.178 SEV

Send Event is a hint instruction. It causes an event to be signaled to all PEs in the multiprocessor system. For more information, see *Wait For Event and Send Event* on page G1-3834.

### A1



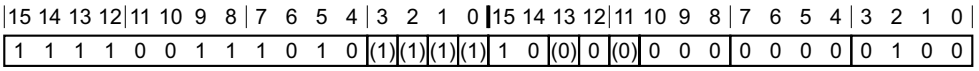
#### *A1 variant*

```
SEV{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1



#### *T1 variant*

```
SEV{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T2

#### *T2 variant*

```
SEV{<c>}.W
```

#### *Decode for this encoding*

```
// No additional decoding required
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

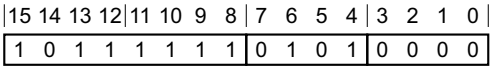
## F6.1.179 SEVL

Send Event Local is a hint instruction. It causes an event to be signaled locally without the requirement to affect other PEs in the multiprocessor system. It can prime a wait-loop which starts with a WFE instruction.

### A1



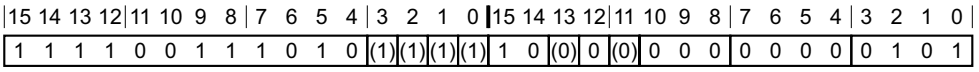
#### *A1 variant*

```
SEVL{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T1



#### *T1 variant*

```
SEVL{<c>}{<q>}
```

#### *Decode for this encoding*

```
// No additional decoding required
```

### T2

#### *T2 variant*

```
SEVL{<c>}.W
```

#### *Decode for this encoding*

```
// No additional decoding required
```

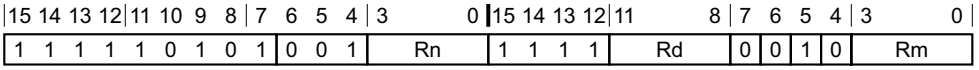
## F6.1.180 SHADD16

Signed Halving Add 16 performs two signed 16-bit integer additions, halves the results, and writes the results to the destination register.

### A1



#### *A1 variant*

```
SHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SHADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

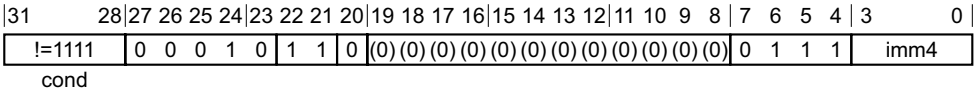
### F6.1.186 SMC

Secure Monitor Call causes a Secure Monitor Call exception. For more information see *Secure Monitor Call (SMC) exception* on page G1-3816.

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in User mode.



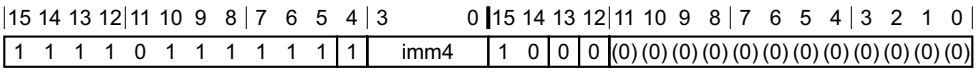
If the values of .TSC and .SCD are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception that is taken to EL3. When EL3 is using AArch32 this exception is taken to Monitor mode. When EL3 is using AArch64, it is the SCR_EL3.SMD bit, rather than the .SCD bit, that can change the effect of executing an SMC instruction.

If the value of .TSC is 1, execution of an SMC instruction in a Non-secure EL1 mode generates an exception that is taken to EL2, regardless of the value of .SCD. When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information see .

If the value of .TSC is 0 and the value of .SCD is 1, the SMC instruction is:

- UNDEFINED in Non-secure state.
- CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

#### A1



##### *A1 variant*

```
SMC{<c>}{<q>} {#}<imm4>
```

##### *Decode for this encoding*

```
// imm4 is for assembly/disassembly only and is ignored by hardware
```

#### T1

##### *T1 variant*

```
SMC{<c>}{<q>} {#}<imm4>
```

##### *Decode for this encoding*

```
// imm4 is for assembly/disassembly only and is ignored by hardware
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<q> See *Standard assembler syntax fields* on page F2-2446.

<imm4> Is a 4-bit unsigned immediate value, in the range 0 to 15, encoded in the "imm4" field. This is ignored by the PE. The Secure Monitor Call exception handler (Secure Monitor code) can use this value to determine what service is being requested, but ARM does not recommend this.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    if !HaveEL(EL3) || PSTATE.EL == EL0 then
        UNDEFINED;

    AArch32.CheckForSMCTrap();

    if !ELUsingAArch32(EL3) then
        if SCR_EL3.SMD == '1' then
            // SMC disabled.
            UNDEFINED;
    else
        if SCR.SCD == '1' then
            // SMC disabled
            if IsSecure() then
                // Executes either as a NOP or UNALLOCATED.
                c = ConstrainUnpredictable(Unpredictable_SMD);
                assert c IN {Constraint_NOP, Constraint_UNDEF};
                if c == Constraint_NOP then EndOfInstruction();
            UNDEFINED;

    if !ELUsingAArch32(EL3) then
        AArch64.CallSecureMonitor(Zeros(16));
    else
        AArch32.TakeSMCException();
```

## F6.1.187 SMLABB, SMLABT, SMLATB, SMLATT

Signed Multiply Accumulate (halfwords) performs a signed multiply accumulate operation. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is added to a 32-bit accumulate value and the result is written to the destination register.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. It is not possible for overflow to occur during the multiplication.

### A1

#### *SMLABB variant*

Applies when `M = 0 && N = 0`.

```
SMLABB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMLABT variant*

Applies when `M = 1 && N = 0`.

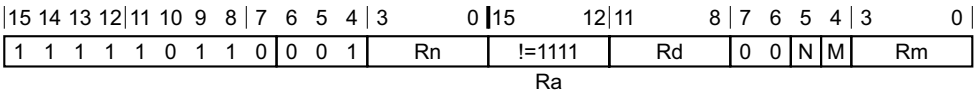
```
SMLABT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMLATB variant*

Applies when `M = 0 && N = 1`.

```
SMLATB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMLATT variant*



Applies when `M = 1 && N = 1`.

```
SMLATT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
n_high = (N == '1');  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

### T1

Non-Confidential - Beta

## F6.1.188 SMLAD, SMLADX

Signed Multiply Accumulate Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets PSTATE.Q to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications.

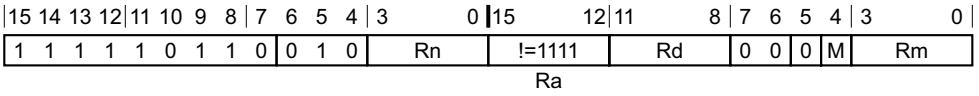
### A1

#### *SMLAD variant*

Applies when `M = 0`.

```
SMLAD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMLADX variant*



Applies when `M = 1`.

```
SMLADX{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
if Ra == '1111' then SEE SMUAD;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *SMLAD variant*

Applies when `M = 0`.

```
SMLAD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMLADX variant*

Applies when `M = 1`.

```
SMLADX{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
if Ra == '1111' then SEE SMUAD;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## F6.1.189 SMLAL, SMLALS

Signed Multiply Accumulate Long multiplies two signed 32-bit values to produce a 64-bit value, and accumulates this with a 64-bit value.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

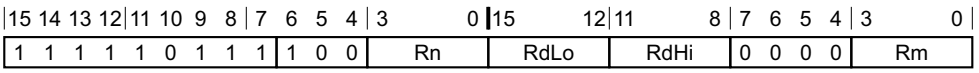
### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
SMLALS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Not flag setting variant*



Applies when `S = 0`.

```
SMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

### Notes for all encodings

<RdLo> Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.

<RdHi> Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.

<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

## Operation for all encodings

```
 if ConditionPassed() then
     EncodingSpecificOperations();
     result = SInt(R[n]) * SInt(R[m]) + SInt(R

[dHi]:R[dLo]);
     R[dHi] = result<63:32>;
     R[dLo] = result<31:0>;
     if setflags then
         PSTATE.N = result<63>;
         PSTATE.Z = IsZeroBit(result<63:0>);
         // PSTATE.C, PSTATE.V unchanged
```

## F6.1.190 SMLALBB, SMLALBT, SMLALTB, SMLALTT

Signed Multiply Accumulate Long (halfwords) multiplies two signed 16-bit values to produce a 32-bit value, and accumulates this with a 64-bit value. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is sign-extended and accumulated with a 64-bit accumulate value.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo $2^{64}$.

### A1

#### *SMLALBB variant*

Applies when `M = 0 && N = 0`.

```
SMLALBB{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *SMLALBT variant*

Applies when `M = 1 && N = 0`.

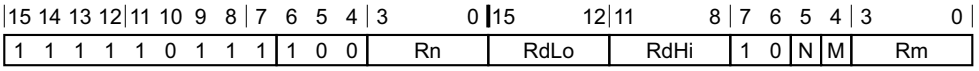
```
SMLALBT{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *SMLALTB variant*

Applies when `M = 0 && N = 1`.

```
SMLALTB{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *SMLALTT variant*



Applies when `M = 1 && N = 1`.

```
SMLALTT{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);
n_high = (N == '1');  m_high = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

### T1

#### *SMLALBB variant*

Applies when `N = 0 && M = 0`.

```
SMLALBB{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

## F6.1.191 SMLALD, SMLALDX

Signed Multiply Accumulate Long Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 64-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo $2^{64}$.

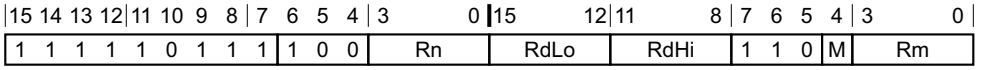
### A1

#### *SMLALD variant*

Applies when `M = 0`.

```
SMLALD{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *SMLALDX variant*



Applies when `M = 1`.

```
SMLALDX{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

### T1

#### *SMLALD variant*

Applies when `M = 0`.

```
SMLALD{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *SMLALDX variant*

Applies when `M = 1`.

```
SMLALDX{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```

## F6.1.192 SMLAWB, SMLAWT

Signed Multiply Accumulate (word by halfword) performs a signed multiply accumulate operation. The multiply acts on a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are added to a 32-bit accumulate value and the result is written to the destination register. The bottom 16 bits of the 48-bit product are ignored.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. No overflow can occur during the multiplication.

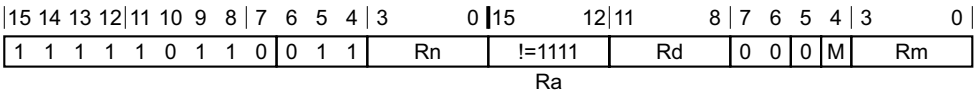
### A1

#### *SMLAWB variant*

Applies when `M = 0`.

```
SMLAWB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMLAWT variant*



Applies when `M = 1`.

```
SMLAWT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

### T1

#### *SMLAWB variant*

Applies when `M = 0`.

```
SMLAWB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMLAWT variant*

Applies when `M = 1`.

```
SMLAWT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
if Ra == '1111' then SEE SMULWB, SMULWT;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## F6.1.196 SMMLS, SMMLSR

Signed Most Significant Word Multiply Subtract multiplies two signed 32-bit values, subtracts the result from a 32-bit accumulate value that is shifted left by 32 bits, and extracts the most significant 32 bits of the result of that subtraction.

Optionally, the instruction can specify that the result of the instruction is rounded instead of being truncated. In this case, the constant `0x80000000` is added to the result of the subtraction before the high word is extracted.

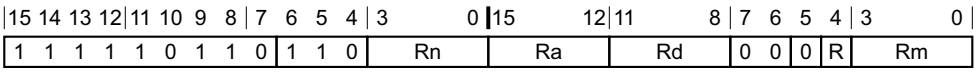
### A1

#### *SMMLS variant*

Applies when `R = 0`.

```
SMMLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMMLSR variant*



Applies when `R = 1`.

```
SMMLSR{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  round = (R == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

### T1

#### *SMMLS variant*

Applies when `R = 0`.

```
SMMLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *SMMLSR variant*

Applies when `R = 1`.

```
SMMLSR{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);  round = (R == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## F6.1.197 SMMUL, SMMULR

Signed Most Significant Word Multiply multiplies two signed 32-bit values, extracts the most significant 32 bits of the result, and writes those bits to the destination register.

Optionally, the instruction can specify that the result is rounded instead of being truncated. In this case, the constant `0x80000000` is added to the product before the high word is extracted.

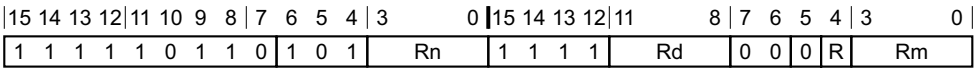
### A1

#### *SMMUL variant*

Applies when `R = 0`.

```
SMMUL{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMMULR variant*



Applies when `R = 1`.

```
SMMULR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  round = (R == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *SMMUL variant*

Applies when `R = 0`.

```
SMMUL{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMMULR variant*

Applies when `R = 1`.

```
SMMULR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  round = (R == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## F6.1.198 SMUAD, SMUADX

Signed Dual Multiply Add performs two signed 16 x 16-bit multiplications. It adds the products together, and writes the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets PSTATE.Q to 1 if the addition overflows. The multiplications cannot overflow.

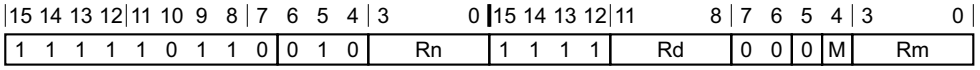
### A1

#### *SMUAD variant*

Applies when `M = 0`.

```
SMUAD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMUADX variant*



Applies when `M = 1`.

```
SMUADX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *SMUAD variant*

Applies when `M = 0`.

```
SMUAD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMUADX variant*

Applies when `M = 1`.

```
SMUADX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

## F6.1.199 SMULBB, SMULBT, SMULTB, SMULTT

Signed Multiply (halfwords) multiplies two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is written to the destination register. No overflow is possible during this instruction.

### A1

#### *SMULBB variant*

Applies when `M = 0 && N = 0`.

```
SMULBB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMULBT variant*

Applies when `M = 1 && N = 0`.

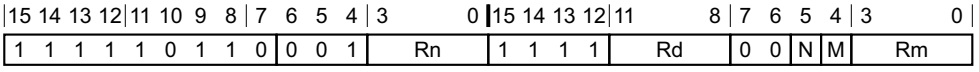
```
SMULBT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMULTB variant*

Applies when `M = 0 && N = 1`.

```
SMULTB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMULTT variant*



Applies when `M = 1 && N = 1`.

```
SMULTT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
n_high = (N == '1');  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *SMULBB variant*

Applies when `N = 0 && M = 0`.

```
SMULBB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMULBT variant*

Applies when `N = 0 && M = 1`.

```

## F6.1.200 SMULL, SMULLS

Signed Multiply Long multiplies two 32-bit signed values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

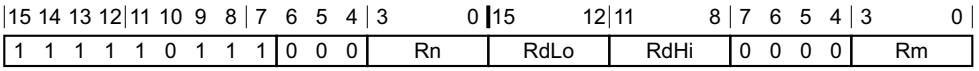
### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
SMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Not flag setting variant*



Applies when `S = 0`.

```
SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *SMULL* on page K1-5457.

### Assembler symbols

## F6.1.201 SMULWB, SMULWT

Signed Multiply (word by halfword) multiplies a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are written to the destination register. The bottom 16 bits of the 48-bit product are ignored. No overflow is possible during this instruction.

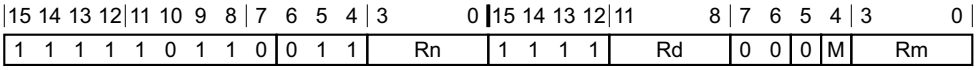
### A1

#### *SMULWB variant*

Applies when `M = 0`.

```
SMULWB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMULWT variant*



Applies when `M = 1`.

```
SMULWT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *SMULWB variant*

Applies when `M = 0`.

```
SMULWB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMULWT variant*

Applies when `M = 1`.

```
SMULWT{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

## F6.1.202 SMUSD, SMUSDX

Signed Multiply Subtract Dual performs two signed 16 x 16-bit multiplications. It subtracts one of the products from the other, and writes the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow cannot occur.

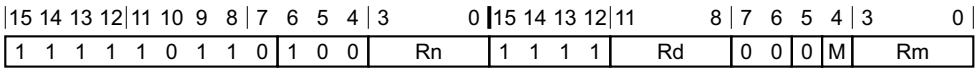
### A1

#### *SMUSD variant*

Applies when `M = 0`.

```
SMUSD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMUSDX variant*



Applies when `M = 1`.

```
SMUSDX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *SMUSD variant*

Applies when `M = 0`.

```
SMUSD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *SMUSDX variant*

Applies when `M = 1`.

```
SMUSDX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

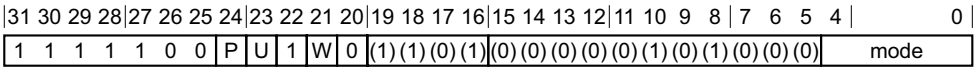
## F6.1.203 SRS, SRSDA, SRSDB, SRSIA, SRSIB

Store Return State stores the LR_<current_mode> and SPSR_<current_mode> to the stack of a specified mode. For information about memory accesses see *Memory accesses* on page F2-2452.

SRS is UNDEFINED in Hyp mode.

SRS is UNPREDICTABLE if it is executed in User or System mode, or if the specified mode is any of the following:



- Not implemented.
- A mode that  does not show.
- Not accessible from the context that the SRS instruction is executed in, as follows:
  - A mode that is at a higher Exception level.
  - When executing in Non-secure state, Monitor mode.

SRS is trapped to EL3 if all of the following are true:

- It is executed at Secure PL1.
- The specified mode is monitor mode.
- EL3 is using AArch64.

See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-1602.

### A1

#### *Decrement After variant*

Applies when `P = 0 && U = 0`.

```
SRSDA{<c>}{<q>} SP{!}, #<mode>
```

#### *Decrement Before variant*

Applies when `P = 1 && U = 0`.

```
SRSDB{<c>}{<q>} SP{!}, #<mode>
```

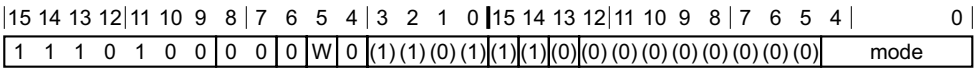
#### *Increment After variant*

Applies when `P = 0 && U = 1`.

```
SRS{IA}{<c>}{<q>} SP{!}, #<mode>
```

#### *Increment Before variant*

Applies when `P = 1 && U = 1`.



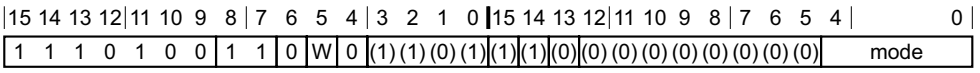
```
SRSIB{<c>}{<q>} SP{!}, #<mode>
```

#### *Decode for all variants of this encoding*

```
wback = (W == '1');  increment = (U == '1');  wordhigher = (P == U);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T1



#### *T1 variant*

```
SRSDB{<c>}{<q>} SP{!}, #<mode>
```

#### *Decode for this encoding*

```
wback = (W == '1');  increment = FALSE;  wordhigher = FALSE;
```

### T2

#### *T2 variant*

```
SRS{IA}{<c>}{<q>} SP{!}, #<mode>
```

#### *Decode for this encoding*

```
wback = (W == '1');  increment = TRUE;  wordhigher = FALSE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *SRS (T32)* on page K1-5482 and .

## Assembler symbols

| | |
|---|---|
| IA | For encoding A1: is an optional suffix to indicate the Increment After variant.<br>For encoding T2: is an optional suffix for the Increment After form. |
| <c> | For encoding A1: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted.<br>For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| ! | The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0. |
| <mode> | Is the number of the mode whose Banked SP is used as the base register, encoded in the "mode" field. For details of PE modes and their numbers see . |

SRSFA, SRSEA, SRSFD, and SRSED are pseudo-instructions for SRSIB, SRSIA, SRSDB, and SRSDA respectively, referring to their use for pushing data onto Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

## F6.1.204 SSAT

Signed Saturate saturates an optionally-shifted signed value to a selectable signed range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

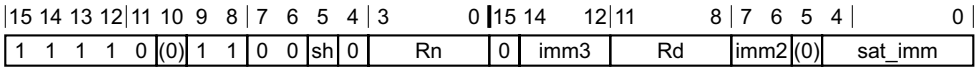
### A1

#### *Arithmetic shift right variant*

Applies when `sh = 1`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

#### *Logical shift left variant*



Applies when `sh = 0`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *Arithmetic shift right variant*

Applies when `sh = 1 && !(imm3 == 000 && imm2 == 00)`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

#### *Logical shift left variant*

Applies when `sh = 0`.

```
SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

#### *Decode for all variants of this encoding*

```
if sh == '1' && (imm3:imm2) == '00000' then SEE SSAT16;
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

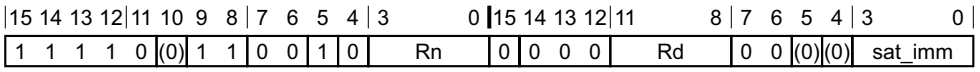
## F6.1.205 SSAT16

Signed Saturate 16 saturates two signed 16-bit values to a selected signed range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

### A1



#### *A1 variant*

```
SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm)+1;
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

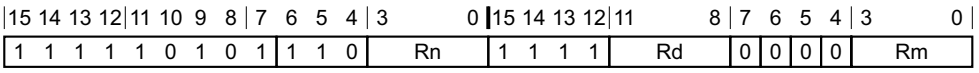
## F6.1.206 SSAX

Signed Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer subtraction and one 16-bit addition, and writes the results to the destination register. It sets PSTATE.GE according to the results.

### A1



#### *A1 variant*

```
SSAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SSAX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

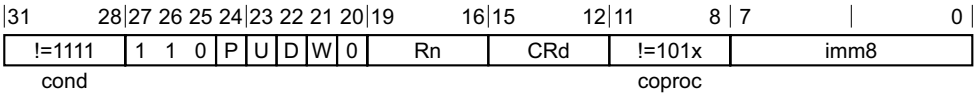
## F6.1.209 STC, STC2



Store Coprocessor stores data from a conceptual coprocessor to a sequence of consecutive memory addresses.

This is a generic coprocessor instruction. The coproc field identifies the target conceptual coprocessor. This must be one of CP10, CP11, CP14, or CP15, and for these CP values, this manual defines the imm8, CRd, and D field values that are valid STC and STC2 instructions. Other encodings are UNDEFINED. For more information see *Conceptual coprocessor support* on page E1-2353 and *General behavior of System registers* on page G4-4118.

In an implementation that includes EL2, the permitted STC access to a System register can be trapped to Hyp mode, meaning that an attempt to execute an STC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see *Trapping general Non-secure System register accesses to debug registers* on page G1-3871.

For simplicity, the STC pseudocode does not show this possible trap to Hyp mode.

### A1

#### *Offset variant*

Applies when P = 1 && W = 0.

```
STC{L}{<c>}{<q>} <coproc>, <CRd>, [<Rn>{, #{+/-}<imm>}]
```

#### *Post-indexed variant*

```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STC, STC2* on page K1-5458.

Advanced SIMD and floating-point: Extension register load/store instructions.

## Assembler symbols

| | |
|---|---|
| `L` | If specified, selects the D == 1 form of the encoding. If omitted, selects the D == 0 form. |
| `<c>` | For encoding A1, T1 and T2: see *Standard assembler syntax fields* on page F2-2446.<br>For encoding A2: see *Standard assembler syntax fields* on page F2-2446. `<c>` must be `AL` or omitted. |
| `<q>` | See *Standard assembler syntax fields* on page F2-2446. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<coproc>` Is the name of the coprocessor, encoded in the "coproc" field. The valid coprocessor names are p10, p11, p14, and p15.

`<CRd>` Is the coprocessor register to be transferred, encoded in the "CRd" field.

`<Rn>` For encoding A1, A2: is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding A1, A2, T1, T2: is the general-purpose base register, encoded in the "Rn" field.

`<option>` Is a coprocessor option, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    Coproc_CheckInstr(cp, ThisInstr());
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    repeat
        MemA[address,4] = Coproc_GetWordToStore(cp, ThisInstr());
        address = address + 4;
    until Coproc_DoneStoring(cp, ThisInstr());
    if wback then R[n] = offset_addr;
```

if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

### Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Rd>` is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemO[address, 4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

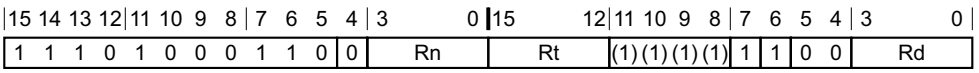
### F6.1.213 STLEXB

Store-Release Exclusive Byte stores a byte from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

#### A1



##### *A1 variant*

```
STLEXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

##### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

#### T1

##### *T1 variant*

```
STLEXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

##### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

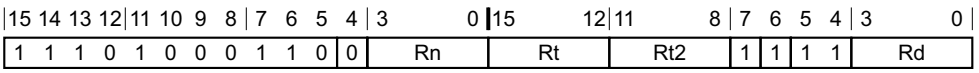
## F6.1.214 STLEXD

Store-Release Exclusive Doubleword stores a doubleword from two registers to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page B2-89.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
STLEXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STLEXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STLEXD* on page K1-5459.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. `<Rt>` must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. `<Rt2>` must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

### Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Rd>` is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address, 8) then
        MemO[address, 8] = value;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

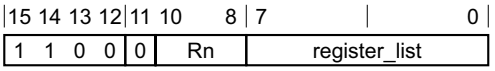
## F6.1.217 STM, STMIA, STMEA

Store Multiple (Increment After, Empty Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

For details of related system instructions see STM (User registers).

### A1



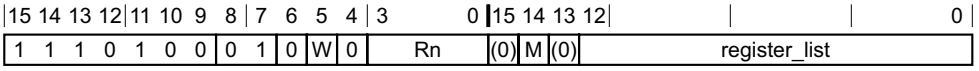
#### *A1 variant*

```
STM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
STM{IA}{<c>}{<q>} <Rn>!, <registers> // Preferred syntax
STMEA{<c>}{<q>} <Rn>!, <registers> // Alternate syntax, Empty Ascending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = '00000000':register_list;  wback = TRUE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

### T2

#### *T2 variant*

```
STM{IA}{<c>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented
in T1
STMEA{<c>}.W <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack, if <Rn>, '!' and
<registers> can be represented in T1
STM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### *Decode for this encoding*

```
n = UInt(Rn);  registers = '0':M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STM (STMIA, STMEA)* on page K1-5460.

## Assembler symbols

`IA` Is an optional suffix for the Increment After form.

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`!` The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

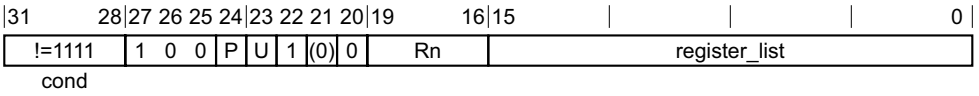
`<registers>` For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field. If the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T2: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encodings T1 and A1
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then  // Only possible for encoding A1
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] + 4*BitCount(registers);
```



Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F6.1.218 STM (User registers)

In an EL1 mode other than System mode, Store Multiple (User registers) stores multiple User mode registers to consecutive memory locations using an address from a base register. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Store Multiple (User registers) is UNDEFINED in Hyp mode, and CONSTRAINED UNPREDICTABLE in User or System modes.

#### A1

##### *A1 variant*

```
STM{<amode>}{<c>}{<q>} <Rn>, <registers>^
```

##### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  increment = (U == '1');  wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

#### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STM (User registers)* on page K1-5483.

#### Assembler symbols

<amode> is one of:

| | |
|---|---|
| DA | Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0. |
| ED | Empty Descending. For this instruction, a synonym for DA. |
| DB | Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0. |
| FD | Full Descending. For this instruction, a synonym for DB. |
| IA | Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1. |
| EA | Empty Ascending. For this instruction, a synonym for IA. |
| IB | Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1. |
| FA | Full Ascending. For this instruction, a synonym for IB. |

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

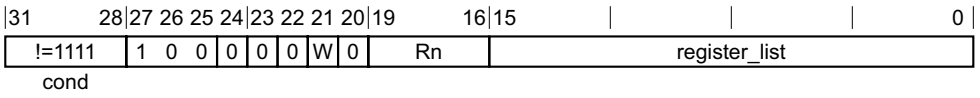
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<registers> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be stored by the STM instruction. The registers are stored with the lowest-numbered register to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then  // Store User mode register
                MemA[address,4] = Rmode[i, M32_User];
                address = address + 4;
        if registers<15> == '1' then
            MemA[address,4] = PCStoreValue();
```

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*



## F6.1.219 STMDA, STMED

Store Multiple Decrement After (Empty Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

For details of related system instructions see STM (User registers).

### A1

#### *A1 variant*

```
STMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMED{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Descending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STMDA (STMED)* on page K1-5462.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rn> | Is the general-purpose base register, encoded in the "Rn" field. |
| ! | The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0. |
| <registers> | Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register. |

### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;
            else
                MemA[address,4] = R[i];
            address = address + 4;
```

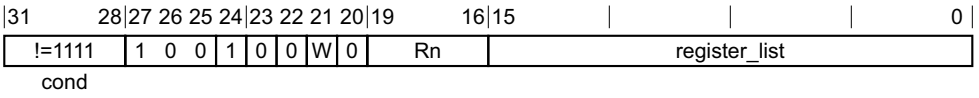
## F6.1.220 STMDB, STMFD



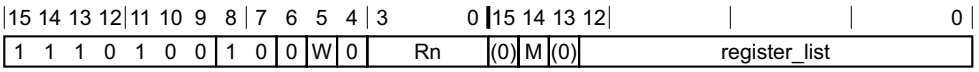
Store Multiple Decrement Before (Full Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the first of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

For details of related system instructions see STM (User registers).

This instruction is used by the alias PUSH (multiple registers). See the *Alias conditions* on page F6-3048 table for details of when each alias is preferred.

### A1



#### *A1 variant*

```
STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = '0':M:'0':register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STMDB (STMFD)* on page K1-5461.

### Alias conditions

| Alias | is preferred when |
|---|---|
| PUSH (multiple registers) | `W == '1' && Rn == '1101' && BitCount(register_list) > 1` |

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`!` The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

`<registers>` For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list. If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encoding A1
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then  // Only possible for encoding A1
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);
```

## F6.1.221 STMIB, STMFA

Store Multiple Increment Before (Full Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-2453.

For details of related system instructions see STM (User registers).

### A1

#### *A1 variant*

```
STMIB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMFA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack
```

#### *Decode for this encoding*

```
n = UInt(Rn);  registers = register_list;  wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STMIB (STMFA)* on page K1-5463.

### Assembler symbols

## F6.1.222 STR (immediate)

Store Register (immediate) calculates an address from a base register value and an immediate offset, and stores a word from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

This instruction is used by the alias PUSH (single register). See the *Alias conditions* on page F6-3053 table for details of when each alias is preferred.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

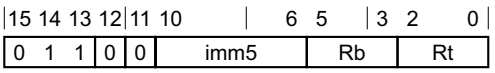
```
STR{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

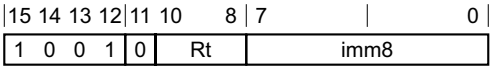
```
STR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if P == '0' && W == '1' then SEE STRT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

### T1

#### *T1 variant*



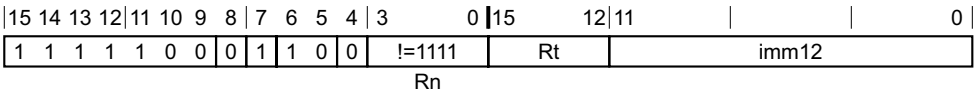
```
STR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T2



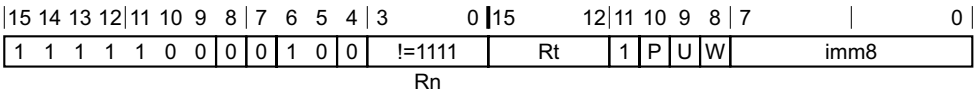
#### *T2 variant*

```
STR{<c>}{<q>} <Rt>, [SP{, #{+}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = 13;  imm32 = ZeroExtend(imm8:'00', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

### T3



#### *T3 variant*

```
STR{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
STR{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
if t == 15 then UNPREDICTABLE;
```

### T4

#### *Offset variant*

Applies when `P = 1 && U = 0 && W = 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 1`.

```
STR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*

Applies when `P = 1 && W = 1`.

```
STR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

Non-Confidential - Beta

### *Decode for all variants of this encoding*

```
if P == '1' && U == '1' && W == '0' then SEE STRT;
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STR (immediate, T32)* on page K1-5464 and .

## Alias conditions

| Alias | of variant | is preferred when |
|---|---|---|
| PUSH (single register) | A1 (pre-indexed) | `P == '1' && U == '0' && W == '1' && Rn == '1101' && imm12 == '000000000100'` |
| PUSH (single register) | T4 (pre-indexed) | `Rn == '1101' && U == '0' && imm8 == '00000100'` |

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1, T2, T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1 and T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.

For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## F6.1.223 STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, stores a word from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

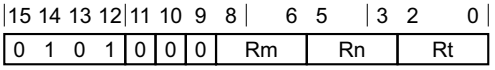
```
STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
STR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

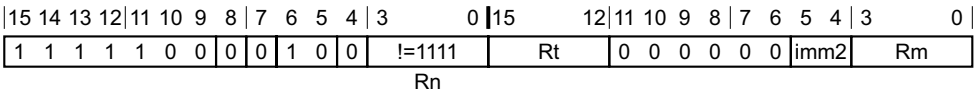
```
STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

#### *Decode for all variants of this encoding*

```
if P == '0' && W == '1' then SEE STRT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

### T1

#### *T1 variant*



```
STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### T2

#### *T2 variant*

```
STR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

#### *Decode for this encoding*

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STR (register)* on page K1-5465.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`+` Specifies the index register is added to the base register.

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`<shift>` The shift to apply to the value read from `<Rm>`. If absent, no shift is applied. Otherwise, see .

`<imm>` If present, the size of the left shift to apply to the value from `<Rm>`, in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as `0b00`.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    if t == 15 then  // Only possible for encoding A1

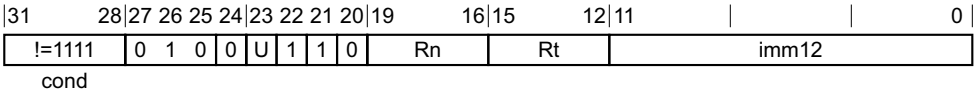
## F6.1.226 STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see *Memory accesses* on page F2-2452.



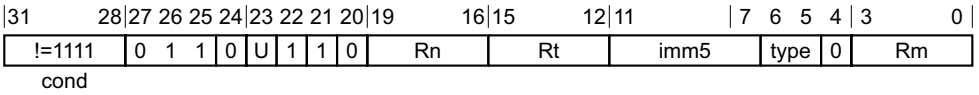
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

### A1



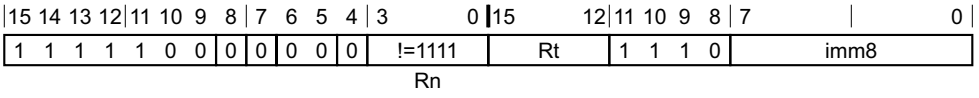
#### *A1 variant*

```
STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

### A2



#### *A2 variant*

```
STRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STRBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

## F6.1.227 STRD (immediate)

Store Register Dual (immediate) calculates an address from a base register value and an immediate offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

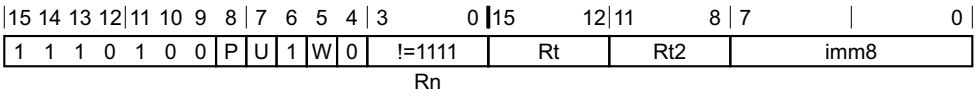
```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
```

### T1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*

Applies when `P = 1 && W = 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #{+/-}<imm>]!
```

Non-Confidential - Beta

### *Decode for all variants of this encoding*

```
if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if n == 15 || t == 15 || t2 == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STRD (immediate)* on page K1-5468.

Related encodings: *Load/store dual, load/store exclusive, table branch* on page F3-2480.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

`<Rt2>` For encoding A1: is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

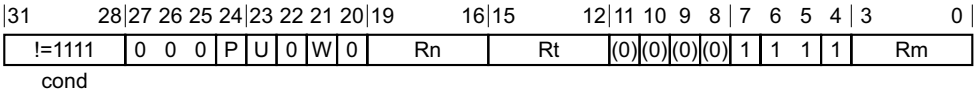
`+/-` Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        bits(64) data;
        if BigEndian() then
            data<63:32> = R[t];
            data<31:0> = R[t2];
        else
            data<31:0> = R[t];
            data<63:32> = R[t2];
        MemA[address,8] = data;
    else
        MemA[address,4] = R[t];
        MemA[address+4,4] = R[t2];
    if wback then R[n] = offset_addr;
```

## F6.1.228 STRD (register)

Store Register Dual (register) calculates an address from a base register value and a register offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>
```

#### *Pre-indexed variant*

Applies when `P = 1 && W = 1`.

```
STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!
```

#### *Decode for all variants of this encoding*

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STRD (register)* on page K1-5470.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

`<Rt2>` Is the second general-purpose register to be transferred. This register must be `<R(t+1)>`.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

`+/-` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`

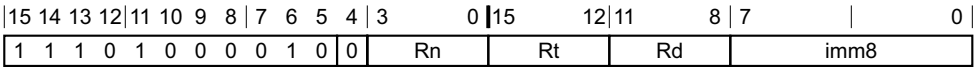
## F6.1.229 STREX

Store Register Exclusive calculates an address from a base register value and an immediate offset, stores a word from a register to the calculated address if the PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, {#}<imm>}]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = Zeros(32); // Zero offset
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, #<imm>}]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STREX* on page K1-5471.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<imm> For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted.

For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

## Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

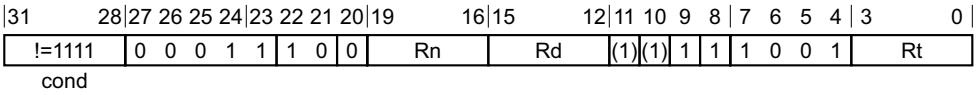
A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemA[address,4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```



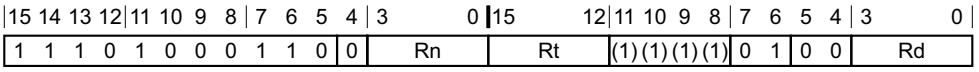
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.230 STREXB

Store Register Exclusive Byte derives an address from a base register value, stores a byte from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STREXB* on page K1-5471.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

## Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        MemA[address,1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

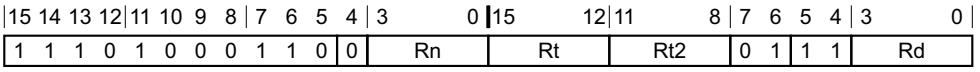
## F6.1.231 STREXD

Store Register Exclusive Doubleword derives an address from a base register value, stores a 64-bit doubleword from two registers to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STREXD* on page K1-5472.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rd> must not be the same as <Rn>, <Rt>, or <Rt2>.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

<Rt2> For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

## Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non doubleword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address,8) then
        MemA[address,8] = value;  R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

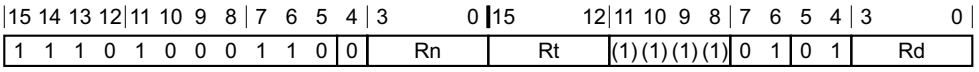
## F6.1.232 STREXH

Store Register Exclusive Halfword derives an address from a base register value, stores a halfword from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-2395. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1



#### *A1 variant*

```
STREXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
STREXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]
```

#### *Decode for this encoding*

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STREXH* on page K1-5472.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- `0` If the operation updates memory.
- `1` If the operation fails to update memory.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

### Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

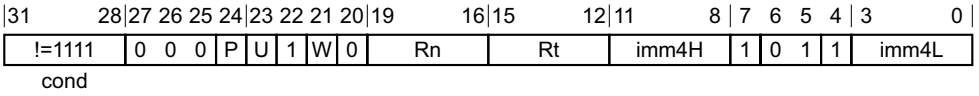
- Memory is not updated.
- <Rd> is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,2) then
        MemA[address,2] = R[t]<15:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

## F6.1.233 STRH (immediate)

Store Register Halfword (immediate) calculates an address from a base register value and an immediate offset, and stores a halfword from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

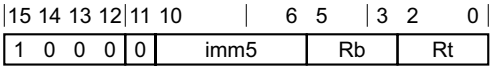
```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+/-}<imm>}]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### *Pre-indexed variant*



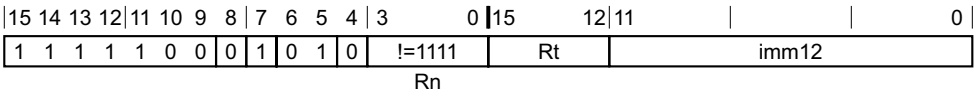
Applies when `P = 1 && W = 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### *Decode for all variants of this encoding*

```
if P == '0' && W == '1' then SEE STRHT;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

### T1



#### *T1 variant*

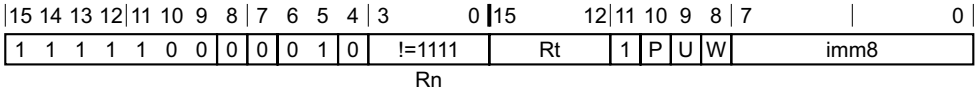
```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm5:'0', 32);
index = TRUE;  add = TRUE;  wback = FALSE;
```

### T2

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta



#### T2 variant

```
STRH{<c>}.W <Rt>, [<Rn> {, #{+}<imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
STRH{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

#### Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm12, 32);
index = TRUE;  add = TRUE;  wback = FALSE;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### T3

#### Offset variant

Applies when `P = 1 && U = 0 && W = 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

#### Post-indexed variant

Applies when `P = 0 && W = 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>
```

#### Pre-indexed variant

Applies when `P = 1 && W = 1`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!
```

#### Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE STRHT;
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8, 32);
index = (P == '1');  add = (U == '1');  wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STRH (immediate, T32)* on page K1-5473 and .

## Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rt> | Is the general-purpose register to be transferred, encoded in the "Rt" field. |
| <Rn> | For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.<br>For encoding A1, T1, T2, T3: is the general-purpose base register, encoded in the "Rn" field. |

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when `U = 0`

+ when `U = 1`

+ Specifies the offset is added to the base register.

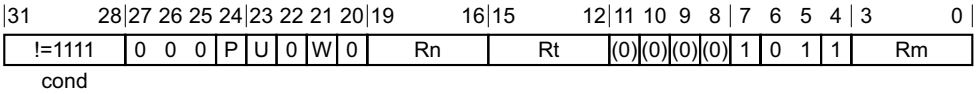
<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings



```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,2] = R[t]<15:0>;
        if wback then R[n] = offset_addr;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,2] = R[t]<15:0>;
        if wback then R[n] = offset_addr;
```

Non-Confidential - Beta

## F6.1.234 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an offset register value, and stores a halfword from a register to memory. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see *Memory accesses* on page F2-2452.

### A1

#### *Offset variant*

Applies when `P = 1 && W = 0`.

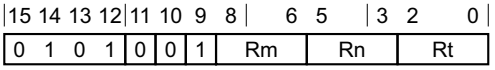
```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]
```

#### *Post-indexed variant*

Applies when `P = 0 && W = 0`.

```
STRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>
```

#### *Pre-indexed variant*



Applies when `P = 1 && W = 1`.

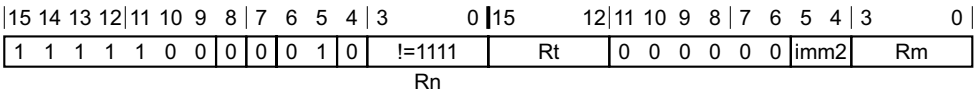
```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!
```

#### *Decode for all variants of this encoding*

```
if P == '0' && W == '1' then SEE STRHT;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRType_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

### T1

#### *T1 variant*



```
STRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

#### *Decode for this encoding*

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

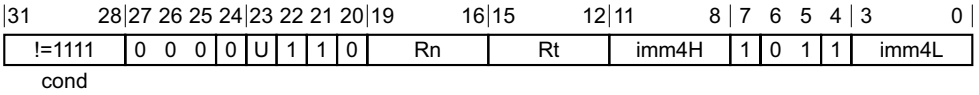
## F6.1.235 STRHT

Store Register Halfword Unprivileged stores a halfword from a register to memory. For information about memory accesses see *Memory accesses* on page F2-2452.



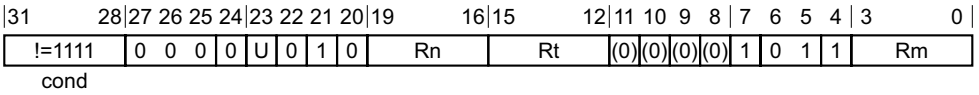
The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1



#### *A1 variant*

### *Decode for this encoding*

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *STRHT* on page K1-5475.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.

`<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

`+/-` For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- `-` when `U = 0`
- `+` when `U = 1`

`<Rm>` Is the general-purpose index register, encoded in the "Rm" field.

`+` Specifies the offset is added to the base register.

`<imm>` For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

## Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,2] = R[t]<15:0>;
    if postindex then R[n] = offset_addr;
```

### F6.1.237 SUB (immediate, from PC)

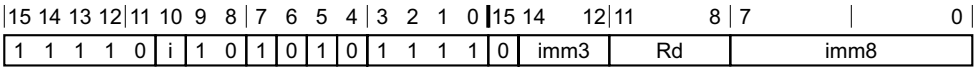
Subtract from PC subtracts an immediate value from the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias

This instruction is an alias of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The description of ADR gives the operational pseudocode for this instruction.

#### A2

##### *A2 variant*



```
SUB{<c>}{<q>} <Rd>, PC, #<const>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is the preferred disassembly when `imm12==000000000000`.

#### T2

##### *T2 variant*

```
SUB{<c>}{<q>} <Rd>, PC, #<imm12>
```

is equivalent to

```
ADR{<c>}{<q>} <Rd>, <label>
```

and is the preferred disassembly when `i:imm3:imm8 = '000000000000'`.

#### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` For encoding A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field.

`<label>` For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset. If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F2-2456.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the `ADR` instruction to this label. If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset. If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`. Permitted values of the size of the offset are 0-4095.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` An immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

## Operation for all encodings

The description of ADR gives the operational pseudocode for this instruction.

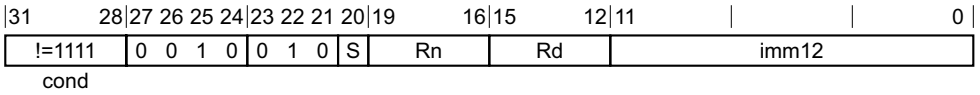
Non-Confidential - Beta

## F6.1.238 SUB, SUBS (immediate)



Subtract (immediate) subtracts an immediate value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The SUBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode, except for encoding T5 with <imm8> set to zero, which is the encoding for the ERET instruction, see ERET.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

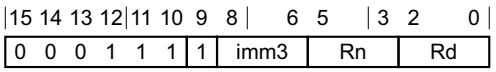
### A1

#### *SUB variant*

Applies when S = 0 && Rn != 11x1.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *SUBS variant*



Applies when S = 1 && Rn != 1101.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

#### *Decode for all variants of this encoding*

```
if Rn == '1111' && S == '0' then SEE ADR;
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

### T1

#### *T1 variant*

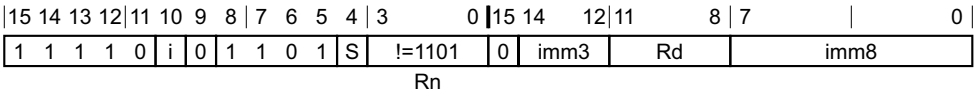
### Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm3, 32);
```

## T2



### T2 variant

```
SUB<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
SUB<c>{<q>} {<Rdn>,} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
SUBS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
SUBS{<q>} {<Rdn>,} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1
```

### Decode for this encoding

```
d = UInt(Rdn);  n = UInt(Rdn);  setflags = !InITBlock();  imm32 = ZeroExtend(imm8, 32);
```

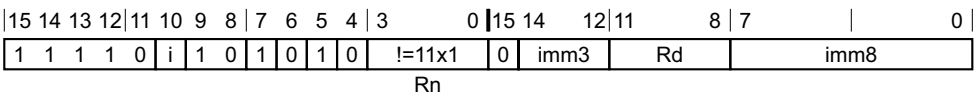
## T3

### SUB variant

Applies when `S = 0`.

```
SUB<c>.W {<Rd>,} <Rn>, #<const> // Inside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or
T2
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### SUBS variant



Applies when `S = 1 && Rd != 1111`.

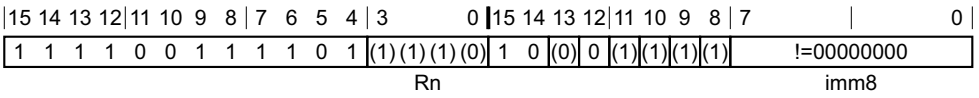
```
SUBS.W {<Rd>,} <Rn>, #<const> // Outside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
SUBS{<c>}{<q>} {<Rd>,} <Rn>, #<const>
```

### Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE CMP (immediate);
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## T4

### T4 variant



```
SUB{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
SUBW{<c>}{<q>} {<Rd>,} <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

#### Decode for this encoding

```
if Rn == '1111' then SEE ADR;
if Rn == '1101' then SEE SUB (SP minus immediate);
d = UInt(Rd);  n = UInt(Rn);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### T5

#### T5 variant

```
SUBS{<c>}{<q>} PC, LR, #<imm8>
```

#### Decode for this encoding

```
if Rn == '1110' && IsZero(imm8) then SEE ERET;
d = 15;  n = UInt(Rn);  setflags = TRUE;  imm32 = ZeroExtend(imm8, 32);
if n != 14 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *SUBS PC. LR and related instructions (A32)* on page K1-5484 and .

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rdn>` Is the general-purpose source and destination register, encoded in the "Rdn" field.

`<imm8>` For encoding T2: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

For encoding T5: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. If `<Rn>` is the LR, and zero is used, see ERET.

`<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. If the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction unless `<Rn>` is the LR.

For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

`<Rn>` For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate). If the PC is used, see ADR.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate).

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

`<imm3>` Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.

`<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

`<const>` For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T3: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

In the T32 instruction set, `MOVS{<c>}{<q>} PC, LR` is a pseudo-instruction for `SUBS{<c>}{<q>} PC, LR, #0`.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), '1');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

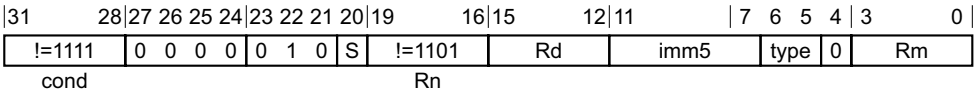
### F6.1.239 SUB, SUBS (register)



Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *SUB, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *SUB, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

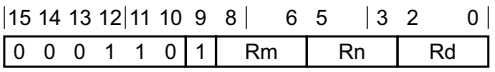
##### *SUBS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

##### *SUBS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
if Rn == '1101' then SEE SUB (SP minus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

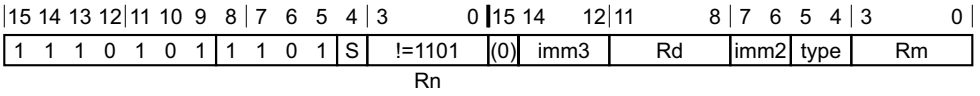
Non-Confidential - Beta

### T1



#### *T1 variant*

```
SUB<c>{<q>} <Rd>, <Rn>, <Rm> // Inside IT block
SUBS{<q>} {<Rd>,} <Rn>, <Rm> // Outside IT block
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *SUB, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *SUB, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
SUB<c>.W {<Rd>,} <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *SUBS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && Rd != 1111 && imm2 = 00 && type = 11`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

#### *SUBS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
SUBS.W {<Rd>,} <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE CMP (register);
if Rn == '1101' then SEE SUB (SP minus register);
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see SUB, SUBS (SP minus register).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus register).

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

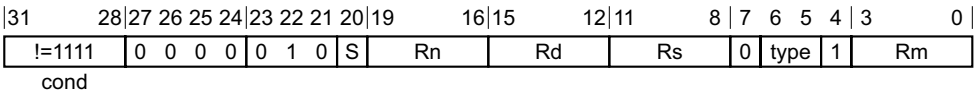
<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

### Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

## F6.1.240 SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Not flag setting variant*

Applies when `S = 0`.

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<type>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<Rs>` Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

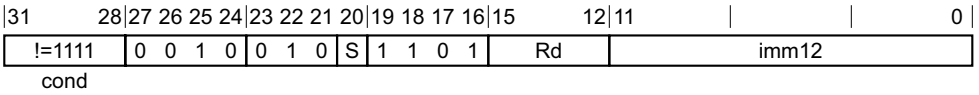
### F6.1.241 SUB, SUBS (SP minus immediate)



Subtract from SP (immediate) subtracts an immediate value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

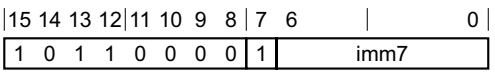
#### A1

##### *SUB variant*

Applies when S = 0.

```
SUB{<c>}{<q>} {<Rd>,} SP, #<const>
```

##### *SUBS variant*



Applies when S = 1.

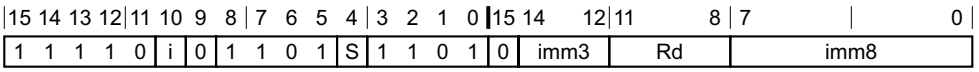
```
SUBS{<c>}{<q>} {<Rd>,} SP, #<const>
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  setflags = (S == '1');  imm32 = A32ExpandImm(imm12);
```

#### T1

##### *T1 variant*



```
SUB{<c>}{<q>} {SP,} SP, #<imm7>
```

##### *Decode for this encoding*

```
d = 13;  setflags = FALSE;  imm32 = ZeroExtend(imm7:'00', 32);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

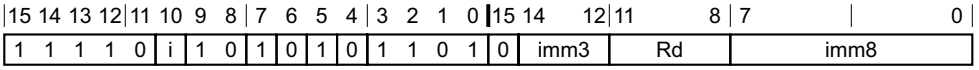
### T2

#### *SUB variant*

Applies when `S = 0`.

```
SUB{<c>}.W {<Rd>,} SP, #<const> // <Rd>, <const> can be represented in T1
SUB{<c>}{<q>} {<Rd>,} SP, #<const>
```

#### *SUBS variant*



Applies when `S = 1 && Rd != 1111`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, #<const>
```

#### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE CMP (immediate);
d = UInt(Rd);  setflags = (S == '1');  imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 && !setflags then UNPREDICTABLE;
```

### T3

#### *T3 variant*

```
SUB{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
SUBW{<c>}{<q>} {<Rd>,} SP, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

#### *Decode for this encoding*

```
d = UInt(Rd);  setflags = FALSE;  imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<imm7> Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. If the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. ARM deprecates use of this instruction unless <Rn> is the LR.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T2: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(SP, NOT(imm32), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

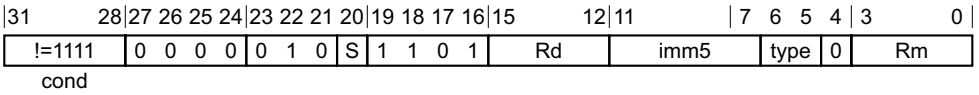
### F6.1.242 SUB, SUBS (SP minus register)



Subtract from SP (register) subtracts an optionally-shifted register value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- The SUBS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-3797.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### A1

##### *SUB, rotate right with extend variant*

Applies when `S = 0 && imm5 = 00000 && type = 11`.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

##### *SUB, shift or rotate by value variant*

Applies when `S = 0 && !(imm5 == 00000 && type == 11)`.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

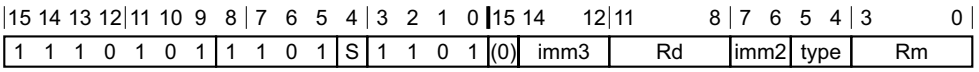
##### *SUBS, rotate right with extend variant*

Applies when `S = 1 && imm5 = 00000 && type = 11`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> , RRX
```

##### *SUBS, shift or rotate by value variant*

Applies when `S = 1 && !(imm5 == 00000 && type == 11)`.



```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

### T1

#### *SUB, rotate right with extend variant*

Applies when `S = 0 && imm3 = 000 && imm2 = 00 && type = 11`.

```
SUB{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

#### *SUB, shift or rotate by value variant*

Applies when `S = 0 && !(imm3 == 000 && imm2 == 00 && type == 11)`.

```
SUB{<c>}.W {<Rd>,} SP, <Rm> // <Rd>, <Rm> can be represented in T1 or T2
SUB{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

#### *SUBS, rotate right with extend variant*

Applies when `S = 1 && imm3 = 000 && Rd != 1111 && imm2 = 00 && type = 11`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm>, RRX
```

#### *SUBS, shift or rotate by value variant*

Applies when `S = 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111`.

```
SUBS{<c>}{<q>} {<Rd>,} SP, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
if Rd == '1111' && S == '1' then SEE CMP (register);
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2318.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(SP, NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

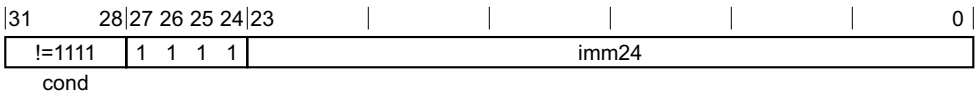
## F6.1.243 SVC

Supervisor Call causes a Supervisor Call exception. For more information, see .

**Note**

SVC was previously called SWI, Software Interrupt, and this name is still found in some documentation.

Software can use this instruction as a call to an operating system to provide a service.



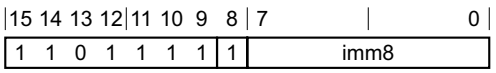
In the following cases, the Supervisor Call exception generated by the SVC instruction is taken to Hyp mode:

- If the SVC is executed in Hyp mode.
- If HCR.TGE is set to 1, and the SVC is executed in Non-secure User mode. For more information, see

In these cases, the HSR identifies that the exception entry was caused by a Supervisor Call exception, EC value 0x11, see *Use of the HSR* on page G4-4105. The immediate field in the HSR:

- If the SVC is unconditional:
  - For the T32 instruction, is the zero-extended value of the imm8 field.
  - For the A32 instruction, is the least-significant 16 bits the imm24 field.
- If the SVC is conditional, is UNKNOWN.

### A1



#### *A1 variant*

```
SVC{<c>}{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
imm32 = ZeroExtend(imm24, 32);
// imm32 is for assembly/disassembly. SVC handlers in some
// systems interpret imm24 in software, for example to determine the required service.
```

### T1

#### *T1 variant*

```
SVC{<c>}{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
imm32 = ZeroExtend(imm8, 32);
// imm32 is for assembly/disassembly. SVC handlers in some
// systems interpret imm8 in software, for example to determine the required service.
```

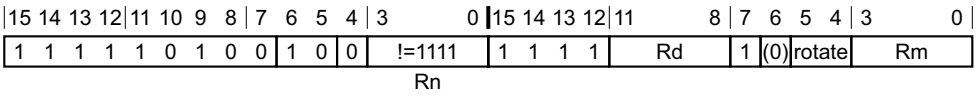
## F6.1.244 SXTAB

Signed Extend and Add Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

### A1



#### *A1 variant*

```
SXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE SXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE SXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<amount>` Is the rotate amount, encoded in the "rotate" field. It can have the following values:

`(omitted)` when `rotate = 00`

`8` when `rotate = 01`

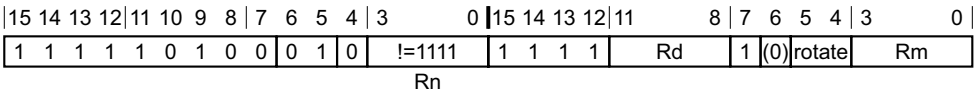
## F6.1.245 SXTAB16

Signed Extend and Add Byte 16 extracts two 8-bit values from a register, sign-extends them to 16 bits each, adds the results to two 16-bit values from another register, and writes the final results to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit values.

### A1



#### *A1 variant*

```
SXTAB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE SXTB16;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SXTAB16{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE SXTB16;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.

`<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

`<amount>` Is the rotate amount, encoded in the "rotate" field. It can have the following values:

`(omitted)` when `rotate = 00`

`8` when `rotate = 01`

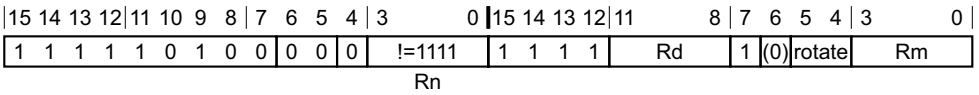
## F6.1.246 SXTAH

Signed Extend and Add Halfword extracts a 16-bit value from a register, sign-extends it to 32 bits, adds the result to a value from another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

### A1



#### *A1 variant*

```
SXTAH{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE SXTH;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
SXTAH{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE SXTH;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

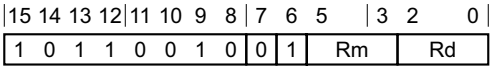
## F6.1.247 SXTB

Signed Extend Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, and writes the result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

### A1



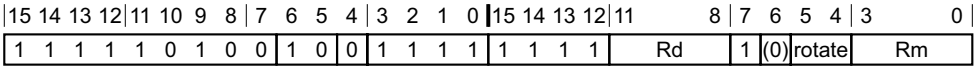
#### *A1 variant*

```
SXTB{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
SXTB{<c>}{<q>} {<Rd>,} <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  rotation = 0;
```

### T2

#### *T2 variant*

```
SXTB{<c>}.W {<Rd>,} <Rm> // <Rd>, <Rm> can be represented in T1
SXTB{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

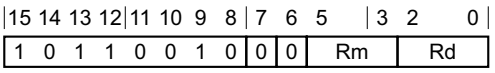
## F6.1.249 SXTH

Signed Extend Halfword extracts a 16-bit value from a register, sign-extends it to 32 bits, and writes the result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

### A1



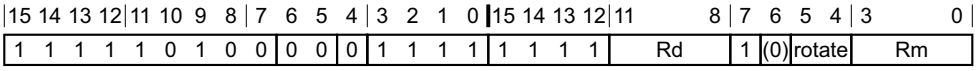
#### *A1 variant*

```
SXTH{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1



#### *T1 variant*

```
SXTH{<c>}{<q>} {<Rd>,} <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  rotation = 0;
```

### T2

#### *T2 variant*

```
SXTH{<c>}.W {<Rd>,} <Rm> // <Rd>, <Rm> can be represented in T1
SXTH{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

## F6.1.250 TBB, TBH

Table Branch Byte or Halfword causes a PC-relative forward branch using a table of single byte or halfword offsets. A base register provides a pointer to the table, and a second register supplies an index into the table. The branch length is twice the value returned from the table.

### T1

#### *Byte variant*

Applies when `H = 0`.

```
TBB{<c>}{<q>} [<Rn>, <Rm>] // Outside or last in IT block
```

#### *Halfword variant*

Applies when `H = 1`.

```
TBH{<c>}{<q>} [<Rn>, <Rm>, LSL #1] // Outside or last in IT block
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);  is_tbh = (H == '1');
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

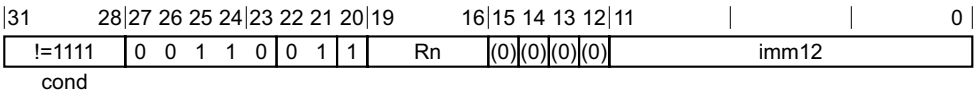
`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` Is the general-purpose base register holding the address of the table of branch lengths, encoded in the "Rn" field. The PC can be used. If it is, the table immediately follows this instruction.

`<Rm>` For the byte variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a single byte in the table. The offset in the table is the value of the index.

For the halfword variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a halfword in the table. The offset in the table is twice the value of the index.

### Operation



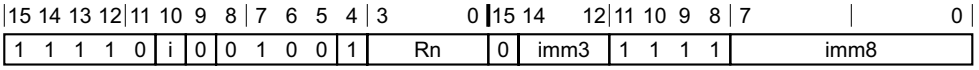
```
if ConditionPassed() then
    EncodingSpecificOperations();
    if is_tbh then
        halfwords = UInt(MemU[R[n]+LSL(R[m],1), 2]);
    else
        halfwords = UInt(MemU[R[n]+R[m], 1]);
    BranchWritePC(PC + 2*halfwords);
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.251 TEQ (immediate)

Test Equivalence (immediate) performs a bitwise exclusive OR operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

### A1



#### *A1 variant*

```
TEQ{<c>}{<q>} <Rn>, #<const>
```

#### *Decode for this encoding*

```
n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

### T1

#### *T1 variant*

```
TEQ{<c>}{<q>} <Rn>, #<const>
```

#### *Decode for this encoding*

```
n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See *Modified immediate constants in A32 instructions* on page F2-2456 for the range of values.

For encoding T1: an immediate value. See *Modified immediate constants in T32 instructions* on page F2-2459 for the range of values.

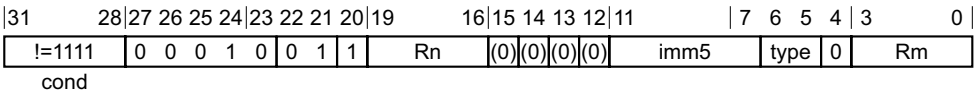
### Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] EOR imm32;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### F6.1.252 TEQ (register)

Test Equivalence (register) performs a bitwise exclusive OR operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

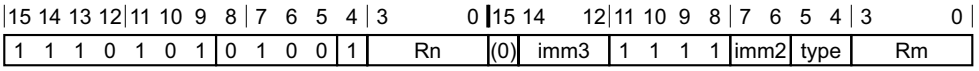
#### A1

##### *Rotate right with extend variant*

Applies when `imm5 = 00000 && type = 11`.

```
TEQ{<c>}{<q>} <Rn>, <Rm>, RRX
```

##### *Shift or rotate by value variant*



Applies when `!(imm5 == 00000 && type == 11)`.

```
TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

#### T1

##### *Rotate right with extend variant*

Applies when `imm3 = 000 && imm2 = 00 && type = 11`.

```
TEQ{<c>}{<q>} <Rn>, <Rm>, RRX
```

##### *Shift or rotate by value variant*

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

```
TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

##### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

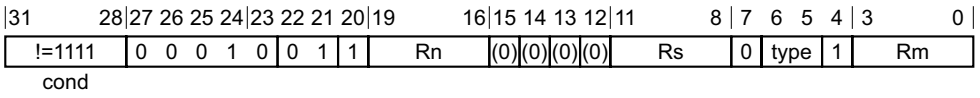
ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

## F6.1.253 TEQ (register-shifted register)

Test Equivalence (register-shifted register) performs a bitwise exclusive OR operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

### A1

#### *A1 variant*

```
TEQ{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

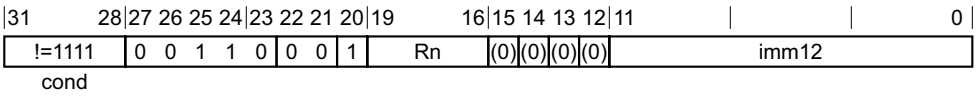
<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

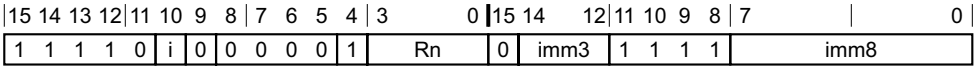
## F6.1.254 TST (immediate)

Test (immediate) performs a bitwise AND operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

### A1



#### *A1 variant*

```
TST{<c>}{<q>} <Rn>, #<const>
```

#### *Decode for this encoding*

```
n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

### T1

#### *T1 variant*

```
TST{<c>}{<q>} <Rn>, #<const>
```

#### *Decode for this encoding*

```
n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## F6.1.255 TST (register)

Test (register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

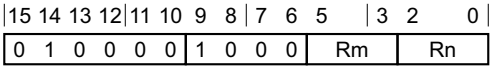
### A1

#### *Rotate right with extend variant*

Applies when `imm5 = 00000 && type = 11`.

```
TST{<c>}{<q>} <Rn>, <Rm>, RRX
```

#### *Shift or rotate by value variant*



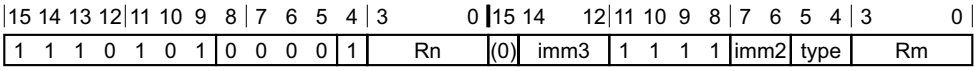
Applies when `!(imm5 == 00000 && type == 11)`.

```
TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

#### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

### T1



#### *T1 variant*

```
TST{<c>}{<q>} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

### T2

#### *Rotate right with extend variant*

Applies when `imm3 = 000 && imm2 = 00 && type = 11`.

```
TST{<c>}{<q>} <Rn>, <Rm>, RRX
```

#### *Shift or rotate by value variant*

Applies when `!(imm3 == 000 && imm2 == 00 && type == 11)`.

Non-Confidential - Beta

```
TST{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1
TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}
```

### *Decode for all variants of this encoding*

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

## Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used.

For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.

`<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

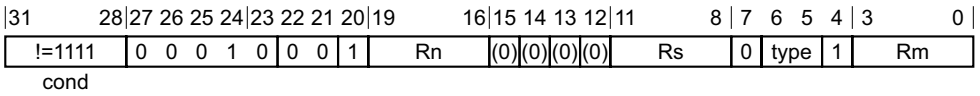
`<shift>` Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| `LSL` | when `type = 00` |
| `LSR` | when `type = 01` |
| `ASR` | when `type = 10` |
| `ROR` | when `type = 11` |

`<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Non-Confidential - Beta

## F6.1.256 TST (register-shifted register)

Test (register-shifted register) performs a bitwise AND operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

### A1

#### *A1 variant*

```
TST{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

#### *Decode for this encoding*

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

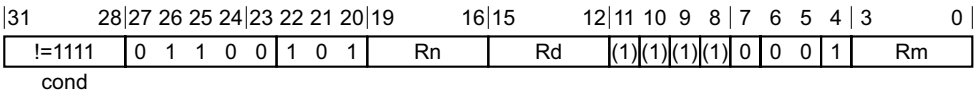
<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

| | |
|---|---|
| LSL | when type = 00 |
| LSR | when type = 01 |
| ASR | when type = 10 |
| ROR | when type = 11 |

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation



```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

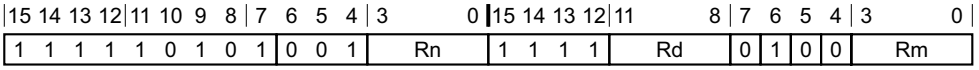
## F6.1.257 UADD16

Unsigned Add 16 performs two 16-bit unsigned integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

### A1



#### *A1 variant*

```
UADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UADD16{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the first general-purpose source register, encoded in the "Rn" field. |
| <Rm> | Is the second general-purpose source register, encoded in the "Rm" field. |

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = UInt(R[n]<15:0>) + UInt(R[m]<15:0>);
    sum2 = UInt(R[n]<31:16>) + UInt(R[m]<31:16>);
    R[d]<15:0>  = sum1<15:0>;
```

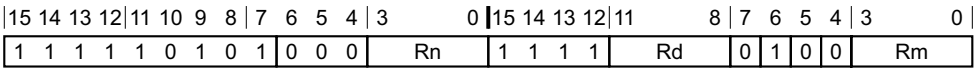
## F6.1.258 UADD8

Unsigned Add 8 performs four unsigned 8-bit integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

### A1



#### *A1 variant*

```
UADD8{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UADD8{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m  == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the first general-purpose source register, encoded in the "Rn" field. |
| <Rm> | Is the second general-purpose source register, encoded in the "Rm" field. |

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = UInt(R[n]<7:0>) + UInt(R[m]<7:0>);
    sum2 = UInt(R[n]<15:8>) + UInt(R[m]<15:8>);
    sum3 = UInt(R[n]<23:16>) + UInt(R[m]<23:16>);
```

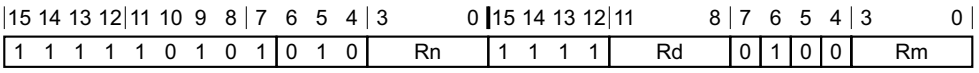
## F6.1.259 UASX

Unsigned Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer addition and one unsigned 16-bit subtraction, and writes the results to the destination register. It sets PSTATE.GE according to the results.

### A1



#### *A1 variant*

```
UASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UASX{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    diff = UInt(R[n]<15:0>) - UInt(R[m]<31:16>);
    sum  = UInt(R[n]<31:16>) + UInt(R[m]<15:0>);
```

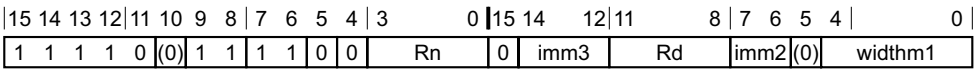
## F6.1.260 UBFX

Unsigned Bit Field Extract extracts any number of adjacent bits at any position from a register, zero-extends them to 32 bits, and writes the result to the destination register.

### A1



#### A1 variant

```
UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

#### Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(lsb);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### T1 variant

```
UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>
```

#### Decode for this encoding

```
d = UInt(Rd);  n = UInt(Rn);
lsbit = UInt(imm3:imm2);  widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *UBFX* on page K1-5476.

## Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the general-purpose source register, encoded in the "Rn" field. |
| <lsb> | For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.<br>For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field. |
| <width> | Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1. |

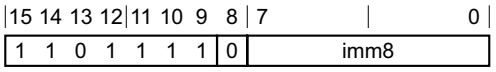
## F6.1.261 UDF

Permanently Undefined generates an Undefined Instruction exception.

The encodings for UDF used in this section are defined as permanently UNDEFINED in the ARMv8-A architecture. However:

- With the T32 instruction set, ARM deprecates using the UDF instruction in an IT block.
- In the A32 instruction set, UDF is not conditional.

### A1



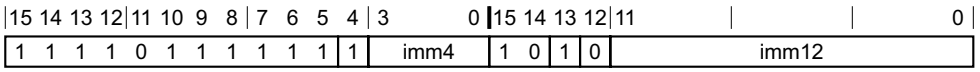
#### *A1 variant*

```
UDF{<c>}{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
imm32 = ZeroExtend(imm12:imm4, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

### T1



#### *T1 variant*

```
UDF{<c>}{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
imm32 = ZeroExtend(imm8, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

### T2

#### *T2 variant*

```
UDF{<c>}.W {#}<imm> // <imm> can be represented in T1
UDF{<c>}{<q>} {#}<imm>
```

#### *Decode for this encoding*

```
imm32 = ZeroExtend(imm4:imm12, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Assembler symbols

<c> For encoding A1: see *Standard assembler syntax fields* on page F2-2446. <c> must be AL or omitted.

For encoding T1 and T2: see *Standard assembler syntax fields* on page F2-2446. ARM deprecates using any <c> value other than AL.

<q> See *Standard assembler syntax fields* on page F2-2446.

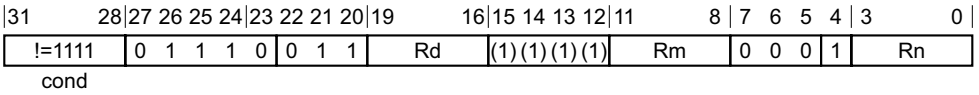
<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. The PE ignores the value of this constant.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. The PE ignores the value of this constant.

For encoding T2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. The PE ignores the value of this constant.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    UNDEFINED;
```



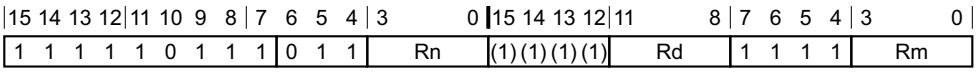
Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

## F6.1.262 UDIV

Unsigned Divide divides a 32-bit unsigned integer register value by a 32-bit unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

See  for more information about this instruction.

### A1



#### *A1 variant*

```
UDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *UDIV* on page K1-5477.

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <Rd> | Is the general-purpose destination register, encoded in the "Rd" field. |
| <Rn> | Is the first general-purpose source register holding the dividend, encoded in the "Rn" field. |
| <Rm> | Is the second general-purpose source register holding the divisor, encoded in the "Rm" field. |

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if UInt(R[m]) == 0 then
```

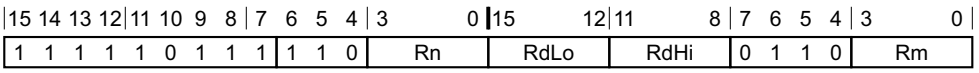
## F6.1.269 UMAAL

Unsigned Multiply Accumulate Accumulate Long multiplies two unsigned 32-bit values to produce a 64-bit value, adds two unsigned 32-bit values, and writes the 64-bit result to two registers.

### A1



#### *A1 variant*

```
UMAAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UMAAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

### Notes for all encodings

## F6.1.270 UMLAL, UMLALS

Unsigned Multiply Accumulate Long multiplies two unsigned 32-bit values to produce a 64-bit value, and accumulates this with a 64-bit value.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

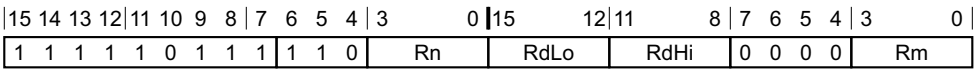
### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
UMLALS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Not flag setting variant*



Applies when `S = 0`.

```
UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *UMLAL* on page K1-5477.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<RdLo> Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.

<RdHi> Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.

<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

## Operation for all encodings

```
 if ConditionPassed() then
     EncodingSpecificOperations();
     result = UInt(R[n]) * UInt(R[m]) + UInt(R

[dHi]:R[dLo]);
     R[dHi] = result<63:32>;
     R[dLo] = result<31:0>;
     if setflags then
         PSTATE.N = result<63>;
         PSTATE.Z = IsZeroBit(result<63:0>);
         // PSTATE.C, PSTATE.V unchanged
```

Non-Confidential - Beta

## F6.1.271 UMULL, UMULLS

Unsigned Multiply Long multiplies two 32-bit unsigned values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

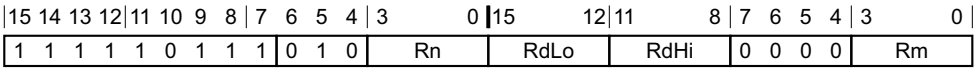
### A1

#### *Flag setting variant*

Applies when `S = 1`.

```
UMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Not flag setting variant*



Applies when `S = 0`.

```
UMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for all variants of this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
```

#### *Decode for this encoding*

```
dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors, and particularly *UMULL* on page K1-5478.

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

## F6.1.280 USAT

Unsigned Saturate saturates an optionally-shifted signed value to a selected unsigned range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

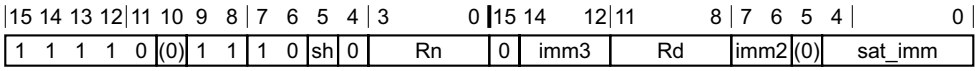
### A1

#### *Arithmetic shift right variant*

Applies when `sh = 1`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

#### *Logical shift left variant*



Applies when `sh = 0`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

#### *Decode for all variants of this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *Arithmetic shift right variant*

Applies when `sh = 1 && !(imm3 == 000 && imm2 == 00)`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>
```

#### *Logical shift left variant*

Applies when `sh = 0`.

```
USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}
```

#### *Decode for all variants of this encoding*

```
if sh == '1' && (imm3:imm2) == '00000' then SEE USAT16;
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

Non-Confidential - Beta

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<imm> Is the bit position for saturation, in the range 0 to 31, encoded in the "sat_imm" field.

<Rn> Is the general-purpose source register, encoded in the "Rn" field.

<amount> For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.

For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field.

For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C);  // PSTATE.C ignored
    (result, sat) = UnsignedSatQ(SInt(operand), saturate_to);
    R[d] = ZeroExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
```

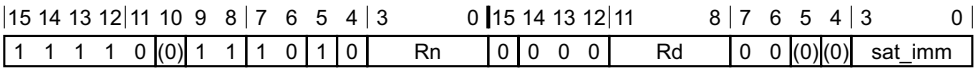
Non-Confidential - Beta

## F6.1.281 USAT16

Unsigned Saturate 16 saturates two signed 16-bit values to a selected unsigned range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

### A1



#### *A1 variant*

```
USAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
USAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>
```

#### *Decode for this encoding*

```
d = UInt(Rd);  n = UInt(Rn);  saturate_to = UInt(sat_imm);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

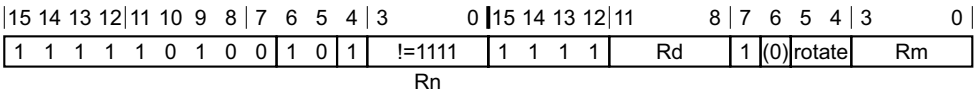
## F6.1.285 UXTAB

Unsigned Extend and Add Byte extracts an 8-bit value from a register, zero-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

### A1



#### *A1 variant*

```
UXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE UXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

### T1

#### *T1 variant*

```
UXTAB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}
```

#### *Decode for this encoding*

```
if Rn == '1111' then SEE UXTB;
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

### F6.1.291 WFE

Wait For Event is a hint instruction that permits the PE to enter a low-power state until one of a number of events occurs, including events signaled by executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait For Event and Send Event* on page G1-3834.

As described in *Wait For Event and Send Event* on page G1-3834, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- *Traps to Undefined mode of EL0 execution of WFE and WFI instructions* on page G1-3849.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-3865.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-3875.

## F6.1.293 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction see *The Yield instruction* on page F1-2425.

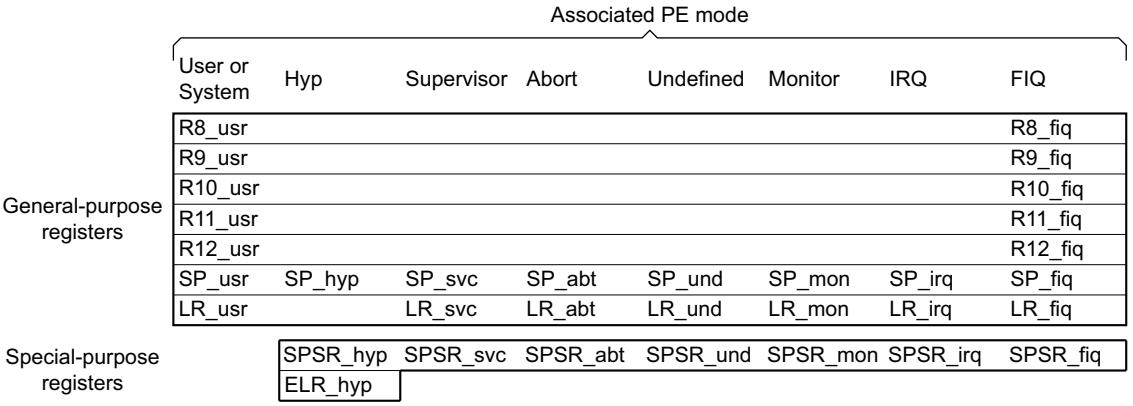
## F6.2 Encoding and use of Banked register transfer instructions



Software executing at EL1 or higher can use the MRS (Banked register) and MSR (Banked register) instructions to transfer values between the general-purpose registers and Special-purpose registers. One particular use of these instructions is for a hypervisor to save or restore the register values of a Guest OS. The following sections give more information about these instructions:

- *Register arguments in the Banked register transfer instructions*.
- *Usage restrictions on the Banked register transfer instructions* on page F6-3203.
- *Encoding the register argument in the Banked register transfer instructions* on page F6-3204.
- *Pseudocode support for the Banked register transfer instructions* on page F6-3205.

For descriptions of the instructions see *MRS (Banked register)* on page F6-2832 and *MSR (Banked register)* on page F6-2835.

### F6.2.1 Register arguments in the Banked register transfer instructions

Figure F6-1 shows the Banked general-purpose registers and Special-purpose registers:

For the general-purpose registers, if no other register is shown, the *current mode register* is the _usr register. So, for example, the full set of current mode registers, including the registers that are not banked:

- For Hyp mode, is {R0_usr - R12_usr, SP_hyp, LR_usr, SPSR_hyp, ELR_hyp}.
- For Abort mode, is {R0_usr - R12_usr, SP_abt, LR_abt, SPSR_abt}.

**Figure F6-1 Banking of general-purpose and Special-purpose registers**

Figure F6-1 is based on Figure G1-2 on page G1-3761, that shows the complete set of general-purpose registers and Special-purpose registers accessible in each mode.

**Note**

- System mode uses the same set of registers as User mode. Neither of these modes can access an SPSR, except that System mode can use the MRS (Banked register) and MSR (Banked register) instructions to access some SPSRs, as described in *Usage restrictions on the Banked register transfer instructions* on page F6-3203.
- General-purpose registers R0-R7, that are not Banked, cannot be accessed using the MRS (Banked register) and MSR (Banked register) instructions.
- In addition to the registers shown in Figure F6-1, the DLR and DSPSR are AArch32 System registers that map onto the AArch64 Special-purpose registers DLR_EL0 and DSPSR_EL0. However, DLR and DSPSR are not accessible using the MRS (Banked register) and MSR (Banked register) instructions.

Software using an MRS (Banked register) or MSR (Banked register) instruction specifies one of these registers using a name shown in Figure F6-1, or an alternative name for SP or LR. These registers can be grouped as follows:

**R8-R12** Each of these registers has two Banked copies, _usr and _fiq, for example R8_usr and R8_fiq.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

**SP** There is a Banked copy of SP for every mode except System mode. For example, SP_svc is the SP for Supervisor mode.

**LR** There is a Banked copy of LR for every mode except System mode and Hyp mode. For example, LR_svc is the LR for Supervisor mode.

**SPSR** There is a Banked copy of SPSR for every mode except System mode and User mode.

**ELR_hyp** Except for the operations provided by MRS (Banked register) and MSR (Banked register), ELR_hyp is accessible only from Hyp mode. It is not Banked.

### F6.2.2 Usage restrictions on the Banked register transfer instructions

MRS (Banked register) and MSR (Banked register) instructions are UNPREDICTABLE if any of the following applies:

- The instruction is executed in User mode.
- The instruction accesses a Banked register that is not implemented, or that either:
  - Is not accessible from the current Privilege level and Security state.
  - Can be accessed from the current mode by using a different instruction.

An MRS (Banked register) or an MSR (Banked register) executed:

- At Non-secure EL1 cannot access any Hyp mode Banked registers.
- At Non-secure EL1 or EL2 cannot access any Monitor mode Banked registers.
- In a Secure mode other than Monitor mode cannot access any Hyp Banked registers.

This means that the Banked registers that MRS (Banked register) and MSR (Banked register) instructions cannot access are:

**From Monitor mode**

- The current mode registers R8_usr-R12_usr, SP_mon, LR_mon, and SPSR_mon.

**From Hyp mode**

- The Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The current mode registers R8_usr-R12_usr, SP_hyp, LR_usr, and SPSR_hyp.

**Note**

MRS (Banked register) and MSR (Banked register) instructions can access the current mode register ELR_hyp.

**From FIQ mode**

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_fiq-R12_fiq, SP_fiq, LR_fiq, and SPSR_fiq.

**From System mode**

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_usr, and LR_usr.

**From Supervisor mode, Abort mode, Undefined mode, and IRQ mode**

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
- The current mode registers R8_usr-R12_usr, SP_<current_mode>, LR_<current_mode>, and SPSR_<current_mode>.

If EL3 is using AArch64, all MRS (Banked register) and MSR (Banked register) accesses to the Monitor mode registers from Secure EL1 modes are trapped to EL3. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-1602.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

For more information, see:

- *Encoding the register argument in the Banked register transfer instructions*.
- *Pseudocode support for the Banked register transfer instructions* on page F6-3205.
- *MRS (Banked register)* on page F6-2832.
- *MSR (Banked register)* on page F6-2835.

**Note**

UNPREDICTABLE behavior must not give access to registers that are not accessible from the current Privilege level and Security state.

### F6.2.3 Encoding the register argument in the Banked register transfer instructions

The MRS (Banked register) and MSR (Banked register) instructions include a 5-bit field, SYSm, and an R bit, that together encode the register argument for the instruction.

When the R bit is set to 0, the argument is a register other than a Banked copy of the SPSR, and Table F6-1 shows how the SYSm field defines the required register argument.

**Table F6-1 Banked register encodings when R==0**

| | SYSm<4:3> | | | |
|---|---|---|---|---|
| SYSm<2:0> | 0b00 | 0b01 | 0b10 | 0b11 |
| 0b000 | R8_usr | R8_fiq | LR_irq | UNPREDICTABLE |
| 0b001 | R9_usr | R9_fiq | SP_irq | UNPREDICTABLE |
| 0b010 | R10_usr | R10_fiq | LR_svc | UNPREDICTABLE |
| 0b011 | R11_usr | R11_fiq | SP_svc | UNPREDICTABLE |
| 0b100 | R12_usr | R12_fiq | LR_abt | LR_mon |
| 0b101 | SP_usr | SP_fiq | SP_abt | SP_mon |
| 0b110 | LR_usr | LR_fiq | LR_und | ELR_hyp |
| 0b111 | UNPREDICTABLE | UNPREDICTABLE | SP_und | SP_hyp |

When the R bit is set to 1, the argument is a Banked copy of the SPSR, and Table F6-2 shows how the SYSm field defines the required register argument.

**Table F6-2 Banked register encodings when R==1**

| | SYSm<4:3> | | | |
|---|---|---|---|---|
| SYSm<2:0> | 0b00 | 0b01 | 0b10 | 0b11 |
| 0b000 | UNPREDICTABLE | UNPREDICTABLE | SPSR_irq | UNPREDICTABLE |
| 0b001 | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE |
| 0b010 | UNPREDICTABLE | UNPREDICTABLE | SPSR_svc | UNPREDICTABLE |
| 0b011 | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE |
| 0b100 | UNPREDICTABLE | UNPREDICTABLE | SPSR_abt | SPSR_mon |

Non-Confidential - Beta

**Table F6-2 Banked register encodings when R==1 (continued)**

| | SYSm<4:3> | | | |
|---|---|---|---|---|
| **SYSm<2:0>** | 0b00 | 0b01 | 0b10 | 0b11 |
| 0b101 | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE |
| 0b110 | UNPREDICTABLE | SPSR_fiq | SPSR_und | SPSR_hyp |
| 0b111 | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE | UNPREDICTABLE |

### F6.2.4 Pseudocode support for the Banked register transfer instructions

The pseudocode functions `BankedRegisterAccessValid()` and `SPSRaccessValid()` check the validity of `MRS` (Banked register) and `MSR` (Banked register) accesses. That is, they filter the accesses that are UNPREDICTABLE either because:

- They attempt to access a register that *Usage restrictions on the Banked register transfer instructions* on page F6-3203 shows is not accessible.
- They use an `SYSm<4:0>` encoding that *Encoding the register argument in the Banked register transfer instructions* on page F6-3204 shows as UNPREDICTABLE.

`BankedRegisterAccessValid()` applies to accesses to the banked general-purpose registers, or to ELR_hyp, and `SPSRaccessValid()` applies to accesses to the SPSRs.

# Chapter F7
# T32 and A32 Advanced SIMD and floating-point Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of floating-point and Advanced SIMD instructions* on page F7-3208.

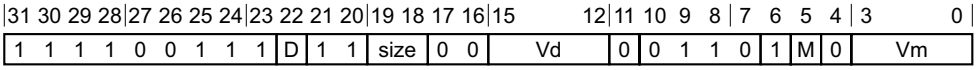
**Note**

Some headings in this chapter use the term *floating-point register*. This is an abbreviated description, and means a register in the Advanced SIMD and floating-point register file.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## F7.1 Alphabetical list of floating-point and Advanced SIMD instructions

This section lists every floating-point and Advanced SIMD instruction in the T32 and A32 instruction sets. For details of the format used see *Format of instruction descriptions* on page F2-2442.



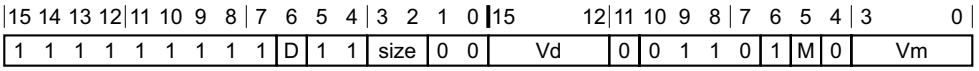
This section is formatted so that each instruction description starts on a new page.

*Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.*
*Non-Confidential - Beta*

## F7.1.1 AESD

AES single round decryption.

### A1



#### *A1 variant*

```
AESD.<dt> <Qd>, <Qm>
```

#### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

### T1

#### *T1 variant*

```
AESD.<dt> <Qd>, <Qm>
```

#### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when `size = 00`

The following encodings are reserved:

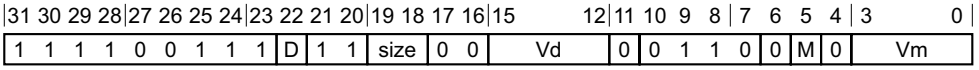
- `size = 01`.
- `size = 1x`.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESInvSubBytes(AESInvShiftRows(op1 EOR op2));
```

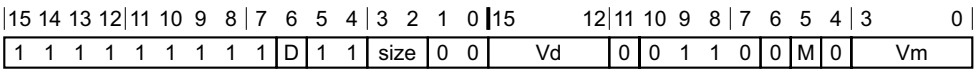
Non-Confidential - Beta

## F7.1.2 AESE

AES single round encryption.

### A1



#### *A1 variant*

```
AESE.<dt> <Qd>, <Qm>
```

#### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

### T1

#### *T1 variant*

```
AESE.<dt> <Qd>, <Qm>
```

#### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when `size = 00`

The following encodings are reserved:

- `size = 01`.
- `size = 1x`.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

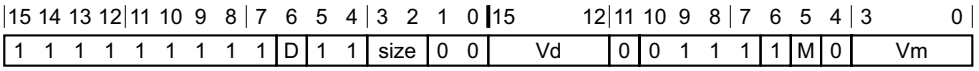
## F7.1.3 AESIMC

AES inverse mix columns.

### A1



#### *A1 variant*

```
AESIMC.<dt> <Qd>, <Qm>
```

#### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

### T1

#### *T1 variant*

```
AESIMC.<dt> <Qd>, <Qm>
```

#### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

### Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when `size = 00`

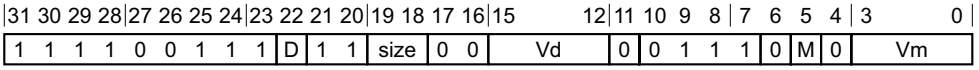
The following encodings are reserved:

- `size = 01`.
- `size = 1x`.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

### Operation for all encodings



```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[d>>1] = AESInvMixColumns(Q[m>>1]);
```

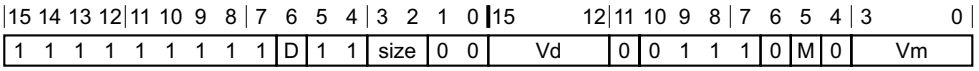
### F7.1.4 AESMC

AES mix columns.

#### A1



##### *A1 variant*

```
AESMC.<dt> <Qd>, <Qm>
```

##### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

#### T1

##### *T1 variant*

```
AESMC.<dt> <Qd>, <Qm>
```

##### *Decode for this encoding*

```
if ! HaveCryptoExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
if InITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Architectural Constraints on UNPREDICTABLE behaviors.

### Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

### F7.1.5 FLDMDBX

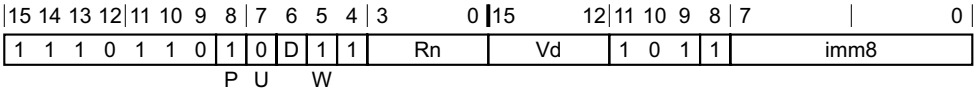
FLDMDBX loads multiple registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register. ARM deprecates use of FLDMDBX, except for disassembly purposes, and reassembly of disassembled code.

This instruction is an alias of the VLDM, VLDMDB, VLDMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VLDM, VLDMDB, VLDMIA.
- The description of VLDM, VLDMDB, VLDMIA gives the operational pseudocode for this instruction.

#### A1

##### *Decrement Before variant*



```
FLDMDBX{<c>}{<q>} <Rn>{!}, <dreglist>
```

is equivalent to

```
VLDMDB{<c>}{<q>} <Rn>{!}, <dreglist>
```

and is the preferred disassembly when `imm8<0> == '1'`.

#### T1

##### *Decrement Before variant*

```
FLDMDBX{<c>}{<q>} <Rn>{!}, <dreglist>
```

is equivalent to

```
VLDMDB{<c>}{<q>} <Rn>{!}, <dreglist>
```

and is the preferred disassembly when `imm8<0> == '1'`.

### Assembler symbols

| | |
|---|---|
| `<c>` | See *Standard assembler syntax fields* on page F2-2446. |
| `<q>` | See *Standard assembler syntax fields* on page F2-2446. |
| `<Rn>` | For encoding A1: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.<br>For encoding T1: is the general-purpose base register, encoded in the "Rn" field. |
| `!` | Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0. |
| `<dreglist>` | Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers. |

### F7.1.6 FLDMIAX

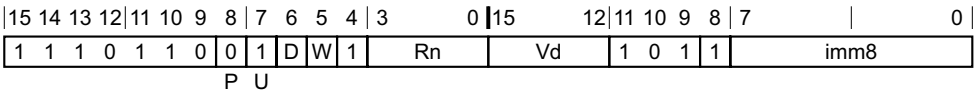
FLDMIAX loads multiple registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register. ARM deprecates use of FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

This instruction is an alias of the VLDM, VLDMDB, VLDMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VLDM, VLDMDB, VLDMIA.
- The description of VLDM, VLDMDB, VLDMIA gives the operational pseudocode for this instruction.

#### A1

##### *Increment After variant*



`FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>`

is equivalent to

`VLDM{<c>}{<q>} <Rn>{!}, <dreglist>`

and is the preferred disassembly when `imm8<0> == '1'`.

#### T1

##### *Increment After variant*

`FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>`

is equivalent to

`VLDM{<c>}{<q>} <Rn>{!}, <dreglist>`

and is the preferred disassembly when `imm8<0> == '1'`.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`!` Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

`<dreglist>` Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

## F7.1.7 FSTMDBX

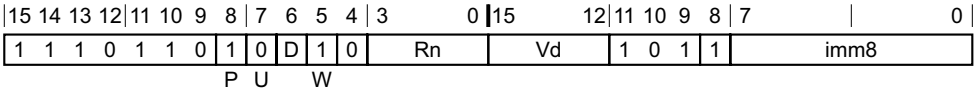
FSTMDBX stores multiple registers from the Advanced SIMD and floating-point register file to consecutive memory locations using an address from a general-purpose register. ARM deprecates use of FSTMDBX, except for disassembly purposes, and reassembly of disassembled code.

This instruction is an alias of the VSTM, VSTMDB, VSTMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VSTM, VSTMDB, VSTMIA.
- The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode for this instruction.

### A1

#### *Decrement Before variant*



`FSTMDBX{<c>}{<q>} <Rn>{!}, <dreglist>`

is equivalent to

`VSTMDB{<c>}{<q>} <Rn>{!}, <dreglist>`

and is the preferred disassembly when `imm8<0> == '1'`.

### T1

#### *Decrement Before variant*

`FSTMDBX{<c>}{<q>} <Rn>{!}, <dreglist>`

is equivalent to

`VSTMDB{<c>}{<q>} <Rn>{!}, <dreglist>`

and is the preferred disassembly when `imm8<0> == '1'`.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`!` Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

`<dreglist>` Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

### F7.1.8 FSTMIAX

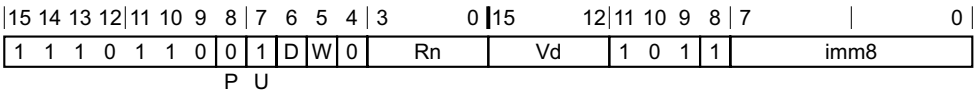
FSTMIAX stores multiple registers from the Advanced SIMD and floating-point register file to consecutive memory locations using an address from a general-purpose register. ARM deprecates use of FSTMIAX, except for disassembly purposes, and reassembly of disassembled code.

This instruction is an alias of the VSTM, VSTMDB, VSTMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VSTM, VSTMDB, VSTMIA.
- The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode for this instruction.

#### A1

##### *Increment After variant*



`FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>`

is equivalent to

`VSTM{<c>}{<q>} <Rn>{!}, <dreglist>`

and is the preferred disassembly when `imm8<0> == '1'`.

#### T1

##### *Increment After variant*

`FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>`

is equivalent to

`VSTM{<c>}{<q>} <Rn>{!}, <dreglist>`

and is the preferred disassembly when `imm8<0> == '1'`.

### Assembler symbols

`<c>` See *Standard assembler syntax fields* on page F2-2446.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

`!` Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

`<dreglist>` Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. ## F7.1.19 VABA

Vector Absolute Difference and Accumulate subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

Operand and result elements are all integers of the same length.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction that is not also available as a floating-point instruction, see *Conditional execution* on page F2-2447.

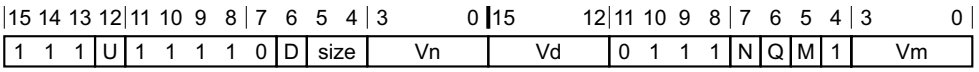
### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VABA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*



Applies when `Q = 1`.

```
VABA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
unsigned = (U == '1');  long_destination = FALSE;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VABA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

```
VABA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

### *Decode for all variants of this encoding*

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
unsigned = (U == '1');  long_destination = FALSE;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446. An A32 VABA or VABAL instruction must be unconditional. ARM strongly recommends that a T32 VABA or VABAL instruction is unconditional, see *Conditional execution* on page F2-2447.

<q> See *Standard assembler syntax fields* on page F2-2446.

<dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

S8 when U = 0, size = 00

S16 when U = 0, size = 01

S32 when U = 0, size = 10

U8 when U = 1, size = 00

U16 when U = 1, size = 01

U32 when U = 1, size = 10

The following encodings are reserved:

- U = 0, size = 11.
- U = 1, size = 11.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize];
            op2 = Elem[Din[m+r],e,esize];
            absdiff = Abs(Int(op1,unsigned) - Int(op2,unsigned));
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + absdiff;
            else
                Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + absdiff;
```

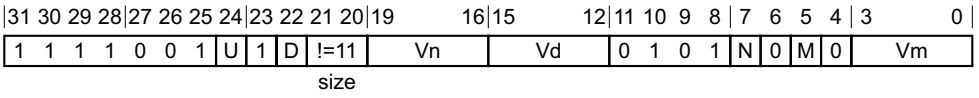
## F7.1.20 VABAL



Vector Absolute Difference and Accumulate Long subtracts the elements of one vector from the corresponding elements of another vector, and accumulates the absolute values of the results into the elements of the destination vector.

Operand elements are all integers of the same length, and the result elements are double the length of the operands.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction that is not also available as a floating-point instruction, see *Conditional execution* on page F2-2447.

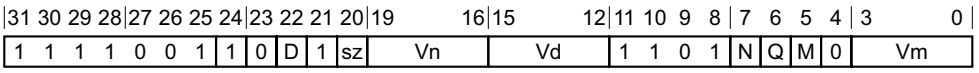
## F7.1.21 VABD (floating-point)



Vector Absolute Difference (floating-point) subtracts the elements of one vector from the corresponding elements of another vector, and places the absolute values of the results in the elements of the destination vector.

Operand and result elements are all single-precision floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2447.

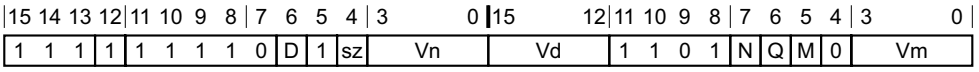
### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VABD{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

#### *128-bit SIMD vector variant*



Applies when `Q = 1`.

```
VABD{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

### T1

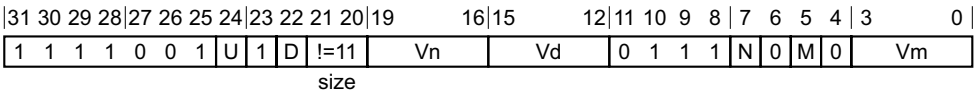
## F7.1.23 VABDL (integer)



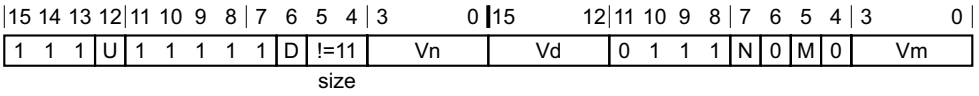
Vector Absolute Difference Long (integer) subtracts the elements of one vector from the corresponding elements of another vector, and places the absolute values of the results in the elements of the destination vector.

Operand elements are all integers of the same length, and the result elements are double the length of the operands.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction that is not also available as a floating-point instruction, see *Conditional execution* on page F2-2447.

### A1



#### *A1 variant*

```
VABDL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

#### *Decode for this encoding*

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1');  long_destination = TRUE;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = 1;
```

### T1

#### *T1 variant*

```
VABDL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

#### *Decode for this encoding*

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1');  long_destination = TRUE;
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = 1;
```

### Notes for all encodings

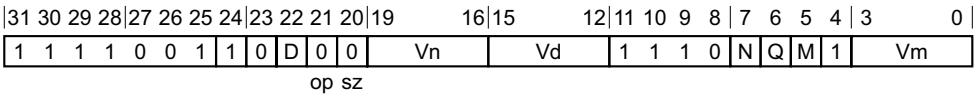
## F7.1.25 VACGE

Vector Absolute Compare Greater Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements must be 32-bit floating-point numbers.



The result vector elements are 32-bit fields.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction that is not also available as a floating-point instruction, see *Conditional execution* on page F2-2447.

This instruction is used by the alias VACLE. See the *Alias conditions* on page F7-3255 table for details of when each alias is preferred.

### A1

#### *64-bit SIMD vector variant*

## F7.1.26 VACLE

Vector Absolute Compare Less Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is an alias of the VACGE instruction. This means that:

- The encodings in this description are named to match the encodings of VACGE.
- The description of VACGE gives the operational pseudocode for this instruction.

### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VACLE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

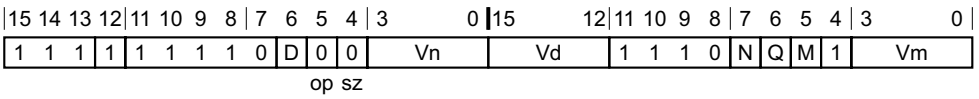
is equivalent to

```
VACGE{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.



```
VACLE{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

is equivalent to

```
VACGE{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>
```

and is never the preferred disassembly.

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VACLE{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

is equivalent to

```
VACGE{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

`VACLE{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>`

is equivalent to

`VACGE{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>`

and is never the preferred disassembly.

### Assembler symbols

`<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

`<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

`<Qm>` Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

`<Qn>` Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

`<c>` See *Standard assembler syntax fields* on page F2-2446. An A32 `VACGE`, `VACGT`, `VACLE`, or `VACLT` instruction must be unconditional. ARM strongly recommends that a T32 `VACGE`, `VACGT`, `VACLE`, or `VACLT` instruction is unconditional, see *Conditional execution* on page F2-2447.

`<q>` See *Standard assembler syntax fields* on page F2-2446.

`<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

`<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

### Operation for all encodings

The description of VACGE gives the operational pseudocode for this instruction.

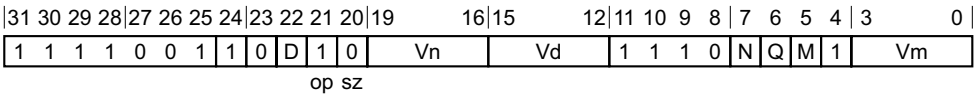
## F7.1.27 VACGT

Vector Absolute Compare Greater Than takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements must be 32-bit floating-point numbers.



The result vector elements are 32-bit fields.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction that is not also available as a floating-point instruction, see *Conditional execution* on page F2-2447.

This instruction is used by the alias VACLT. See the *Alias conditions* on page F7-3259 table for details of when each alias is preferred.

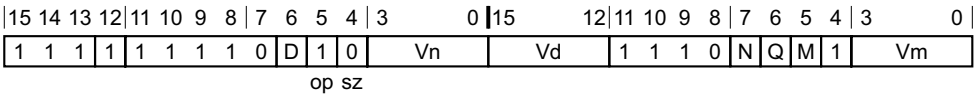
### A1

#### 64-bit SIMD vector variant

Applies when `Q = 0`.

```
VACGT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

#### 128-bit SIMD vector variant



Applies when `Q = 1`.

```
VACGT{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

#### Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
or_equal = (op == '0');  esize = 32;  elements = 2;

```

### Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' then UNDEFINED;
or_equal = (op == '0');  esize = 32;  elements = 2;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

## Alias conditions

| Alias | is preferred when |
|---|---|
| VACLT | Never |

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446. An A32 VACGE, VACGT, VACLE, or VACLT instruction must be unconditional. ARM strongly recommends that a T32 VACGE, VACGT, VACLE, or VACLT instruction is unconditional, see *Conditional execution* on page F2-2447.

<q> See *Standard assembler syntax fields* on page F2-2446.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = FPAbs(Elem[D[n+r],e,esize]);  op2 = FPAbs(Elem[D[m+r],e,esize]);
            if or_equal then
                test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
            else
                test_passed = FPCompareGT(op1, op2, StandardFPSCRValue());
            Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
```

## F7.1.28 VACLT

Vector Absolute Compare Less Than takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros

This instruction is an alias of the VACGT instruction. This means that:

- The encodings in this description are named to match the encodings of VACGT.
- The description of VACGT gives the operational pseudocode for this instruction.

### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VACLT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

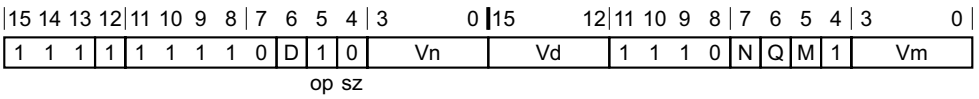
is equivalent to

```
VACGT{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.



```
VACLT{<c>}{<q>}.F32 {<Qd>, }<Qn>, <Qm>
```

is equivalent to

```
VACGT{<c>}{<q>}.F32 <Qd>, <Qm>, <Qn>
```

and is never the preferred disassembly.

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VACLT{<c>}{<q>}.F32 {<Dd>, }<Dn>, <Dm>
```

is equivalent to

```
VACGT{<c>}{<q>}.F32 <Dd>, <Dm>, <Dn>
```

and is never the preferred disassembly.

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

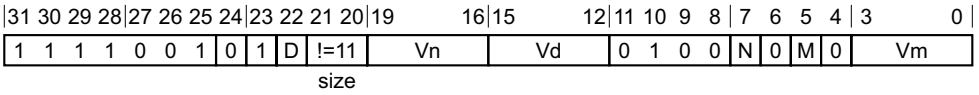
## F7.1.31 VADDHN



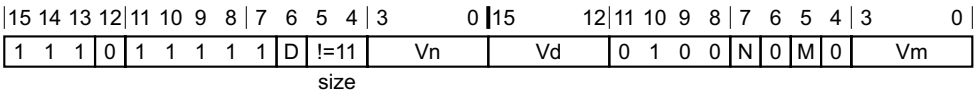
Vector Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are truncated. For rounded results, see VRADDHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2447.

### A1



#### *A1 variant*

```
VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

#### *Decode for this encoding*

<dt> Is the data type for the elements of the second operand vector, encoded in the "U:size" field. It can have the following values:

S8 when U = 0, size = 00

S16 when U = 0, size = 01

S32 when U = 0, size = 10

U8 when U = 1, size = 00

U16 when U = 1, size = 01

U32 when U = 1, size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        if is_vaddw then
            op1 = Int(Elem[Qin[n>>1],e,2*esize], unsigned);
        else
            op1 = Int(Elem[Din[n],e,esize], unsigned);
        result = op1 + Int(Elem[Din[m],e,esize],unsigned);
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

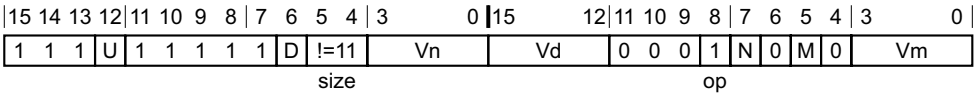
## F7.1.33 VADDW

Vector Add Wide adds corresponding elements in one quadword and one doubleword vector, and places the results in a quadword vector. Before adding, it sign-extends or zero-extends the elements of the doubleword operand.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2447.

### A1



#### *A1 variant*

```
VADDW{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Dm>
```

#### *Decode for this encoding*

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;  is_vaddw = (op == '1');
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

### T1

#### *T1 variant*

```
VADDW{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Dm>
```

#### *Decode for this encoding*

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;  is_vaddw = (op == '1');
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

### Notes for all encodings

Related encodings: Advanced SIMD data-processing instructions

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446. An A32 VADDL or VADDW instruction must be unconditional. ARM strongly recommends that a T32 VADDL or VADDW instruction is unconditional, see *Conditional execution* on page F2-2447.

<q> See *Standard assembler syntax fields* on page F2-2446.

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

<dt> Is the data type for the elements of the second operand vector, encoded in the "U:size" field. It can have the following values:

| | |
|---|---|
| S8 | when U = 0, size = 00 |
| S16 | when U = 0, size = 01 |
| S32 | when U = 0, size = 10 |
| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        if is_vaddw then
            op1 = Int(Elem[Qin[n>>1],e,2*esize], unsigned);
        else
            op1 = Int(Elem[Din[n],e,esize], unsigned);
        result = op1 + Int(Elem[Din[m],e,esize],unsigned);
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;

## F7.1.34 VAND (immediate)

Vector Bitwise AND (immediate) performs a bitwise AND between a register value and an immediate value, and returns the result into the destination vector

This instruction is an alias of the VBIC (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VBIC (immediate).
- The description of VBIC (immediate) gives the operational pseudocode for this instruction.

### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VAND{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

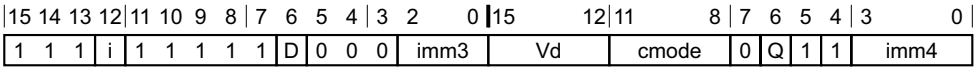
is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Dd>, #~<imm>
```

and is never the preferred disassembly.

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.



```
VAND{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Qd>, #~<imm>
```

and is never the preferred disassembly.

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VAND{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Dd>, #~<imm>
```

and is never the preferred disassembly.

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

```
VAND{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

is equivalent to

```
VBIC{<c>}{<q>}.<dt> <Qd>, #~<imm>
```

and is never the preferred disassembly.

### Assembler symbols

| | |
|---|---|
| `<c>` | See *Standard assembler syntax fields* on page F2-2446. An A32 `VORR` instruction must be unconditional. ARM strongly recommends that a T32 `VORR` instruction is unconditional, see *Conditional execution* on page F2-2447. |
| `<q>` | See *Standard assembler syntax fields* on page F2-2446. |
| `<dt>` | The data type used for `<imm>`. It can be either `I16` or `I32`. `I8`, `I64`, and `F32` are also permitted, but the resulting syntax is a pseudo-instruction. |
| `<Qd>` | Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2. |
| `<Dd>` | Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field. |
| `<imm>` | Is a constant of the type specified by `<dt>` that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<dt>` and `<imm>`, see *One register and a modified immediate value* on page F5-2562. |

### Operation for all encodings

The description of VBIC (immediate) gives the operational pseudocode for this instruction.

## F7.1.35 VAND (register)

Vector Bitwise AND (register) performs a bitwise AND operation between two registers, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2447.

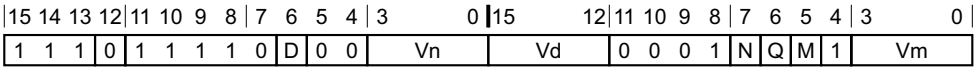
### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*



Applies when `Q = 1`.

```
VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

```
VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

### Assembler symbols

| | |
|---|---|
| <c> | See *Standard assembler syntax fields* on page F2-2446. An A32 VAND instruction must be unconditional. ARM strongly recommends that a T32 VAND instruction is unconditional, see *Conditional execution* on page F2-2447. |
| <q> | See *Standard assembler syntax fields* on page F2-2446. |
| <dt> | An optional data type. It is ignored by assemblers, and does not affect the encoding. |
| <Qd> | Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2. |
| <Qn> | Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2. |
| <Qm> | Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2. |
| <Dd> | Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field. |
| <Dn> | Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field. |
| <Dm> | Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field. |

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND D[m+r];
```

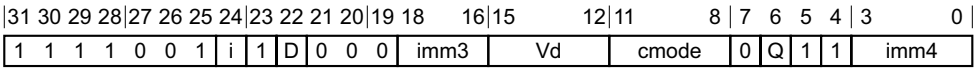
## F7.1.36 VBIC (immediate)



Vector Bitwise Bit Clear (immediate) performs a bitwise AND between a register value and the complement of an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2447.

This instruction is used by the alias VAND (immediate). See the *Alias conditions* on page F7-3278 table for details of when each alias is preferred.

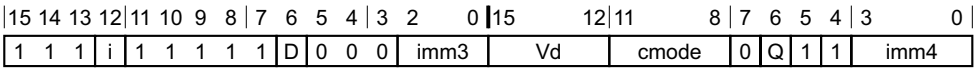
### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VBIC{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

#### *128-bit SIMD vector variant*



Applies when `Q = 1`.

```
VBIC{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

#### *Decode for all variants of this encoding*

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VBIC{<c>}{<q>}.<dt> {<Dd>,} <Dd>, #<imm>
```

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

```
VBIC{<c>}{<q>}.<dt> {<Qd>,} <Qd>, #<imm>
```

Non-Confidential - Beta

#### *Decode for all variants of this encoding*

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd);  regs = if Q == '0' then 1 else 2;
```

### Notes for all encodings

Related encodings: *One register and a modified immediate value* on page F5-2562

### Alias conditions

| Alias | is preferred when |
|---|---|
| VAND (immediate) | Never |

### Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446. An A32 VBIC instruction must be unconditional. ARM strongly recommends that a T32 VBIC instruction is unconditional, see *Conditional execution* on page F2-2447.

<q> See *Standard assembler syntax fields* on page F2-2446.

<dt> The data type used for <imm>. It can be either I16 or I32. I8, I64, and F32 are also permitted, but the resulting syntax is a pseudo-instruction.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<imm> Is a constant of the type specified by <dt> that is replicated to fill the destination register. For details of the range of constants available and the encoding of <dt> and <imm>, see *One register and a modified immediate value* on page F5-2562.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] AND NOT(imm64);
```

## F7.1.38 VBIF

Vector Bitwise Insert if False inserts each bit from the first source register into the destination register if the corresponding bit of the second source register is 0, otherwise leaves the bit in the destination register unchanged.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2447.

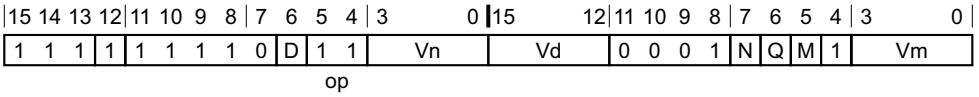
### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VBIF{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*



Applies when `Q = 1`.

```
VBIF{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if op == '00' then SEE VEOR;
if op == '01' then operation = VBitOps_VBSL;
if op == '10' then operation = VBitOps_VBIT;
if op == '11' then operation = VBitOps_VBIF;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VBIF{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

```
VBIF{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if op == '00' then SEE VEOR;
if op == '01' then operation = VBitOps_VBSL;
```

Copyright © 2013-2015 ARM Limited or its affiliates. All rights reserved.
Non-Confidential - Beta

```
if op == '10' then operation = VBitOps_VBIT;
if op == '11' then operation = VBitOps_VBIF;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446. An A32 VBIF, VBIT, or VBSL instruction must be unconditional. ARM strongly recommends that a T32 VBIF, VBIT, or VBSL instruction is unconditional, see *Conditional execution* on page F2-2447.

<q> See *Standard assembler syntax fields* on page F2-2446.

<dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

## Operation for all encodings

```
enumeration VBitOps {VBitOps_VBIF, VBitOps_VBIT, VBitOps_VBSL};

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        case operation of
            when VBitOps_VBIF  D[d+r] = (D[d+r] AND D[m+r]) OR (D[n+r] AND NOT(D[m+r]));
            when VBitOps_VBIT  D[d+r] = (D[n+r] AND D[m+r]) OR (D[d+r] AND NOT(D[m+r]));
            when VBitOps_VBSL  D[d+r] = (D[n+r] AND D[d+r]) OR (D[m+r] AND NOT(D[d+r]));
```

```

## Assembler symbols

<c> See *Standard assembler syntax fields* on page F2-2446. An A32 VBIF, VBIT, or VBSL instruction must be unconditional. ARM strongly recommends that a T32 VBIF, VBIT, or VBSL instruction is unconditional, see *Conditional execution* on page F2-2447.

<q> See *Standard assembler syntax fields* on page F2-2446.

<dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

## Operation for all encodings

```
enumeration VBitOps {VBitOps_VBIF, VBitOps_VBIT, VBitOps_VBSL};

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        case operation of
            when VBitOps_VBIF  D[d+r] = (D[d+r] AND D[m+r]) OR (D[n+r] AND NOT(D[m+r]));
            when VBitOps_VBIT  D[d+r] = (D[n+r] AND D[m+r]) OR (D[d+r] AND NOT(D[m+r]));
            when VBitOps_VBSL  D[d+r] = (D[n+r] AND D[d+r]) OR (D[m+r] AND NOT(D[d+r]));
```

## F7.1.40 VBSL

Vector Bitwise Select sets each bit in the destination to the corresponding bit from the first source operand when the original destination bit was 1, otherwise from the second source operand.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.

ARM deprecates the conditional execution of any Advanced SIMD instruction encoding that is not also available as a floating-point instruction encoding, see *Conditional execution* on page F2-2447.

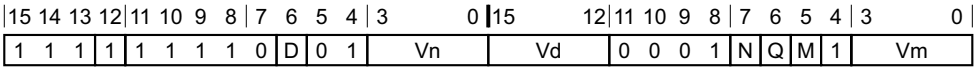
### A1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VBSL{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*



Applies when `Q = 1`.

```
VBSL{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if op == '00' then SEE VEOR;
if op == '01' then operation = VBitOps_VBSL;
if op == '10' then operation = VBitOps_VBIT;
if op == '11' then operation = VBitOps_VBIF;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;
```

### T1

#### *64-bit SIMD vector variant*

Applies when `Q = 0`.

```
VBSL{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

#### *128-bit SIMD vector variant*

Applies when `Q = 1`.

```
VBSL{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

#### *Decode for all variants of this encoding*

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if op == '00' then SEE VEOR;
if op == '01' then operation = VBitOps_VBSL;
```

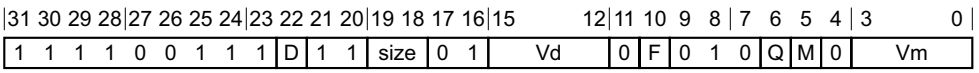
## F7.1.41 VCEQ (immediate #0)

Vector Compare Equal to Zero takes each element in a vector, and compares it with zero. If it is equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:



- 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.
- 32-bit floating-point numbers.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the security state and mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-3841.
